113. What are the two major roots of the psychology family tree? Describe their relationship. What areas of interest do they share?

ANSWER:

The psychology family tree includes two major roots: philosophy and the physical sciences. Psychologists answer questions traditionally posed by philosophers by borrowing the methods of the physical sciences.

Philosophers and psychologists share an interest in questions regarding the nature of the self, the effects of early experience, the existence of free will, and the origin of knowledge. Both disciplines consider the relative balance of biological factors (nature) and environmental factors (nurture) in the end product of human behavior. Both attempt to determine the relationships between self-interest and the welfare of the community, between body and mind, and between humans and the other species with whom we share the planet. Although we typically consider questions of the unconscious mind and abnormal behavior to be the realm of the psychologist, philosophers investigated these issues thousands of years before the first psychologist was born.

REFERENCES: What Are Psychologys Roots?

114. In a famous speech given in 1926, John B. Watson made the following claim:

Give me a dozen healthy infants, well-formed, and my own specified world to bring them up in and I'll guarantee to take any one at random and train him to become any type of specialist I might select—a doctor, lawyer, artist, merchant-chief, and yes, even into beggarman and thief, regardless of his talents, penchants, tendencies, abilities, vocations, and race of his ancestors.

Place this statement in historical perspective. Do you agree or disagree? Explain your reasoning.

ANSWER:

John B. Watson (1878–1958) was a behaviorist. Psychologists following the behaviorist perspective concentrated on observable, measurable behaviors and dominated psychology for the first half of the 20th century. Watson echoed the "blank slate" approach of the British empiricist philosophers in his emphasis on the role of experience in forming behavior. By the 1950s, the behaviorists' disinterest in mental states and activity was challenged by scientists from diverse fields, including linguistics and computer science, leading to a cognitive revolution. In addition, the work of Freud and of humanists provided new perspectives.

Students should discuss whether they agree or disagree with Watson's statement in reference to the nature versus nurture debate. As the text notes, contemporary psychology views the mind as being a function of interactions between inborn characteristics and experiences, not a product of just nature or just nurture.

115. Briefly discuss the phenomenon of drug abuse in the context of five different psychological perspectives.

ANSWER:

The text notes that to understand the phenomenon of drug abuse, many perspectives can contribute to our understanding, but no one specialty offers a complete explanation. Biological psychologists approach drug abuse by tracing pathways in the brain correlated with cravings. Behaviorists focus on the reinforcing qualities of the experience. Behaviorist techniques regarding the use of reward and punishment to shape behavior are also relevant efforts to stop drug use. Developmental and social psychologists consider the family and peer influences. In each case, something valuable is learned about

Discovering Psychology The Science of Mind 2nd Edition Cacioppo Test Bank

Full Download: https://alibabadownload.com/product/discovering-psychology-the-science-of-mind-2nd-edition-cacioppo-test-bank

drug abuse, but understanding the "whole" requires zooming out for a more comprehensive perspective.

The text also notes that there are highly different patterns of use for different drugs. Drawing on multiple perspectives can provide a fuller understanding of the patterns, which may also aid in reducing problematic drug use.

Students might also consider whether other perspectives contribute to an understanding of drug abuse, such as evolutionary, clinical, and individual differences. For example, did an enhanced reaction to natural drug ingredients provide a survival advantage in the past? Clinicians who treat persons with drug addictions may have a wealth of knowledge based on individual cases that may provide a basis for developing hypotheses. Studying individuals who are most or least affected by certain drugs may provide additional information.
