## SYSTEMS OF LINEAR EQUATIONS AND MATRICES

## 2.1 Systems of Linear Equations: An Introduction

Concept Questions page 79

1. a. There may be no solution, a unique solution, or infinitely many solutions.

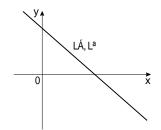

**b.** There is no solution if the two lines represented by the given system of linear equations are parallel and distinct; there is a unique solution if the two lines intersect at precisely one point; there are infinitely many solutions if the two lines are parallel and coincident.

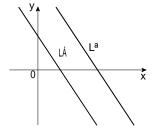

2. a. i. The system is dependent if the two equations in the system describe the same line.

ii. The system is inconsistent if the two equations in the system describe two lines that are parallel and distinct.

b.

Two (coincident) lines in a dependent system

Two lines in an inconsistent system

Exercises page 79

- **1.** Solving the first equation for x, we find  $x \cdot 3y \cdot 1$ . Substituting this value of x into the second equation yields  $4 \cdot 3y \cdot 1 \cdot \cdot 3y \cdot 11$ , so  $12y \cdot 4 \cdot 3y \cdot 11$  and  $y \cdot 1$ . Substituting this value of y into the first equation gives  $x \cdot 3 \cdot 1 \cdot \cdot 1 \cdot 2$ . Therefore, the unique solution of the system is  $2 \cdot 1 \cdot .$
- **2.** Solving the first equation for x, we have  $2x \cdot 4y \cdot 10$ , so  $x \cdot 2y \cdot 5$ . Substituting this value of x into the second equation, we have  $3 \cdot 2y \cdot 5 \cdot 2y \cdot 1$ ,  $6y \cdot 15 \cdot 2y \cdot 1$ ,  $8y \cdot 16$ , and  $y \cdot 2$ . Then  $x \cdot 2 \cdot 2 \cdot 5 \cdot 1$ . Therefore, the solution is  $\cdot 1 \cdot 2 \cdot 3$ .

- **3.** Solving the first equation for *x*, we have  $x \cdot 7 \cdot 4y$ . Substituting this value of *x* into the second equation, we have  $\frac{1}{2} \cdot 7 \cdot 4y \cdot 2y \cdot 5$ , so  $7 \cdot 4y \cdot 4y \cdot 10$ , and  $7 \cdot 10$ . Clearly, this is impossible and we conclude that the system of equations has no solution.
- **4.** Solving the first equation for x, we obtain  $3x \cdot 7 \cdot 4y$ , so  $x \cdot 7_3 \cdot 3_y$ . Substituting this value of x into the second equation, we obtain  $9 \cdot \frac{7}{3} \cdot \frac{4}{3y} \cdot 12y \cdot 14$ , so  $21 \cdot 12y \cdot 12y \cdot 14$ , or  $21 \cdot 14$ . Since this is impossible, we conclude that the system of equations has no solution.
- **5.** Solving the first equation for x, we obtain  $x \cdot 7 \cdot 2y$ . Substituting this value of x into the second equation, we have  $2 \cdot 7 \cdot 2y \cdot y \cdot 4$ , so  $14 \cdot 4y \cdot y \cdot 4$ ,  $5y \cdot 10$ , and  $y \cdot 2$ . Then  $x \cdot 7 \cdot 2 \cdot 2 \cdot 7 \cdot 4 \cdot 3$ . We conclude that the solution to the system is  $3 \cdot 2 \cdot .$
- 6. Solving the second equation for x, we obtain  $x \cdot \frac{1}{3y}$ . 2. Substituting this value of x into the first equation, gives  $\frac{3}{2} \cdot \frac{1}{3y}$ . 2  $2y \cdot 4$ ,  $\frac{1}{2y}$ . 2y. 4. 3,  $\frac{2}{2y}$ . 1, and  $y \cdot \frac{1}{5}$ . Then  $x \cdot 2 \cdot \frac{1}{3} \cdot \frac{2}{5} \cdot \frac{32}{15}$ . Therefore, the solution of the system is  $\frac{32}{15} \cdot \frac{2}{5}$ .
- 7. Solving the first equation for x, we have  $2x \cdot 5y \cdot 10$ , so  $x \cdot 5^2 y \cdot 5$ . Substituting this value of x into the second equation, we have  $6 \cdot 2y \cdot 5 \cdot 15y \cdot 30$ ,  $15y \cdot 30 \cdot 15y \cdot 30$ , and  $0 \cdot 0$ . This result tells us that the second equation is equivalent to the first. Thus, any ordered pair of numbers  $\cdot x \cdot y \cdot$  satisfying the equation  $2x \cdot 5y \cdot 10$  (or  $6x \cdot 15y \cdot 30$ ) is a solution to the system. In particular, by assigning the value t to x, where t is any real number, we find that  $y \cdot 2 \cdot 2^2$  so the ordered pair,  $t \cdot \frac{2}{5t} \cdot 2$  is a solution to the system, and we conclude that the system has infinitely many solutions.
- 8. Solving the first equation for x, we have  $5x \cdot 6y \cdot 8$ , so  $x \cdot {}^{65}y \cdot 5$ . Substituting this value of x into the second equation gives  $10 {}^{6}_{5y} \cdot {}^{8}_{5} \cdot 12y \cdot 16, 12y \cdot 16 \cdot 12y \cdot 16$ , and  $0 \cdot 0$ . This result tells us that the second equation is equivalent to the first. Thus, any ordered pair of numbers  $\cdot x \cdot y \cdot$  satisfying the equation  $5x \cdot 6y \cdot 8$  (or  $10x \cdot 12y \cdot 16$ ) is a solution to the system. In particular, by assigning the value t to x, where t is any real number, we find that  $y \cdot {}^{56}t \cdot {}^{5}_{3}$ . So the ordered pair,  $t \cdot {}^{56}t \cdot {}^{5}_{3}$  is a solution to the system, and we conclude that the system has infinitely many solutions.
- 9. Solving the first equation for x, we obtain  $4x \cdot 5y \cdot 14$ , so  $4x \cdot 14 \cdot 5y$ , and  $x \cdot 44 \cdot 5$ Substituting this value of x into the second equation gives  $2 \begin{bmatrix} 7 \\ 2 \\ 4y \end{bmatrix} \cdot 3y \cdot 4$ , so  $7 \cdot 5 \begin{bmatrix} 4y & 2 \cdot 4y \\ 2y & 3y \cdot 4 \end{bmatrix}$ ,  $4 \cdot 2 \cdot 4$ ,  $11 = 2 \cdot 4 \cdot 2 \cdot 1$ . We conclude that the ordered pair  $1 \cdot 2 \cdot 3$  satisfies the given system of equations.
- **10.** Solving the first equation for x, we have  $\begin{bmatrix} 4 \\ x \end{bmatrix} \begin{bmatrix} 3 \\ y \end{bmatrix} \begin{bmatrix} 3 \\ 3 \end{bmatrix} \begin{bmatrix} 3 \\ y \end{bmatrix} \begin{bmatrix} 3 \\ 3 \end{bmatrix} \begin{bmatrix} 2 \\$

- 11. Solving the first equation for x, we obtain  $2x \cdot 3y \cdot 6$ , so  $x \cdot {}^{32}y \cdot 3$ . Substituting this value of x into the second equation gives  $6 \frac{3}{2y} \cdot 3 \cdot 9y \cdot 12$ , so  $9y \cdot 18 \cdot 9y \cdot 12$  and  $18 \cdot 12$ . which is impossible. We conclude that the system of equations has no solution.
- 12. Solving the first equation for y, we obtain  $x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{23}x^{2$
- **13.** Solving the first equation for x, we obtain  $\cdot 3x \cdot \cdot 5y \cdot 1$ , so  $x \cdot 5$  **.** Substituting this value of y into the second equation yields  $2 \cdot 5 \cdot 3y \cdot 1 \cdot 3y \cdot 3$ ,  $4y \cdot \cdot 1, \frac{49}{3y} \cdot 3 \cdot \frac{4y}{3} \cdot 1, \frac{4y}{3y} \cdot 3, \frac{4y}{3} \cdot \frac{1}{3} \cdot \frac{4y}{3} \cdot \frac{4y}{3} \cdot \frac{1}{3} \cdot \frac{4y}{3} \cdot \frac{1}{3} \cdot \frac{4y}{3} \cdot \frac{1}{3} \cdot \frac$
- $x \cdot {}^{5}_{3} 2 \cdot {}^{1}_{3} {}^{2}_{2}$  and the system has the unique solution **14.** Solving the first equation for x, we obtain  $\cdot 10x \cdot \cdot 15y \cdot 3$ , so  $x \cdot {}^{2}_{32}y = {}^{3}_{40}$ . Substituting this value of y into the second equation yields 4  $\cdot {}^{3}_{3} {}^{3}_{40}$ . Substituting this value of y into the concrude that the system of equations has no solution.  $\cdot {}^{5}_{40} \cdot {}^{65}_{40} \cdot$
- **15.** Solving the first equation for x, we obtain  $3x \cdot 6y \cdot 2$ , so  $x \cdot 2y \cdot \frac{2}{3}$ . Substituting this value of y into the second equation yields  $\cdot \frac{3}{2} 2y \cdot \frac{2}{3} \cdot 3y \cdot 1 \cdot 3y \cdot 1 \cdot 3y \cdot 1$ , and  $0 \cdot 0$ . We conclude that the system of equations has infinitely many solutions of the form  $2t \cdot \frac{2}{3}t$ , where t is a parameter.
- 16. Solving the first equation for x, we obtain  $x^{22}x^{22}y^{-1}$ , so  $x^{-3}y^{-3}$ . Substituting this value of y into the second equation yields  $x^{-3}y^{-1}$ ,  $x^{-3}y^{-3}$ ,  $x^{-3}y^{-3}$ . Substituting this value of y into the second sequation yields  $x^{-3}y^{-1}$ ,  $x^{-3}y^{-3}$ ,  $x^{-3}y^{-3}$ . Substituting this value of y into the second sequation yields  $x^{-3}y^{-1}$ ,  $x^{-3}y^{-3}$ ,  $x^{-3}y^{-3}$ .
- **17.** Solving the first equation for y, we obtain  $y \cdot \cdot 0 \cdot 2x \cdot 1 \cdot 8$ . Substituting this value of y into the second equation gives  $0 \cdot 4x \cdot 0 \cdot 3 \cdot \cdot 0 \cdot 2x \cdot 1 \cdot 8 \cdot 0 \cdot 2, 0 \cdot 34x \cdot 0 \cdot 34$ , and  $x \cdot \cdot 1$ . Substituting this value of x into the first

equation, we have  $y \cdot \cdot 0 \cdot 2 \cdot \cdot 1 \cdot \cdot 1 \cdot 8 \cdot 2$ . Therefore, the solution is  $\cdot \cdot 1 \cdot 2 \cdot .$ 

- **18.** Solving the first equation for x, we find  $0 \cdot 3x \cdot 0 \cdot 4y \cdot 0 \cdot 2$ ,  $3x \cdot 4y \cdot 2$ , and  $x \cdot \frac{4}{3y} \cdot 3$ . Substituting this
- value of x into the second equation, which we rewrite as  $1.2x \cdot 5y \cdot 1$ , we have  $2 \cdot 2 \cdot 5y \cdot 1$ ,  $3y \cdot 3 \cdot 5y \cdot 1$ ,  $3y \cdot 3$ , and  $y \cdot 1$ . Thus,  $x \cdot 43 \cdot 1 \cdot 23 \cdot 3 \cdot 23$  and the unique solution is  $2 \cdot 1 \cdot 3 \cdot 23 \cdot 13 \cdot 3 \cdot 23 \cdot 13 \cdot 3$ . 19. Solving the first equation for y, we obtain  $y \cdot 2x \cdot 3$ . Substituting this value of y into the second equation yields
  - $4x \cdot k \cdot 2x \cdot 3 \cdot 4$ , so  $4x \cdot 2xk \cdot 3k \cdot 4$ ,  $2x \cdot 2 \cdot k \cdot 4 \cdot 3k$ , and  $x \cdot \frac{4 \cdot 3k}{2 \cdot 2 \cdot k}$ . Since x is not defined when the denominator of this last expression is zero, we conclude that the system has no solution when  $k \cdot 2$ .
- **20.** Solving the second equation for x, we have  $x \cdot 4 \cdot ky$ . Substituting this value of x into the first equation gives  $3 \cdot 4 \cdot ky \cdot 4y \cdot 12$ , so  $12 \cdot 3ky \cdot 4y \cdot 12$  and  $y \cdot 3k \cdot 4 \cdot 60$ . Since this last equation is always true when  $k \cdot 4^{3}$  we see that the system has infinitely many solutions when  $k \cdot 3$ . When  $k \cdot 3$ , the solutions are the set of all ordered pairs  $4 \cdot 4^{4}$ , where t is a parameter.  $4 \cdot 4^{4}$ , where t is a parameter.

- 21. Solving the first equation for x in terms of y, we have  $ax \cdot by \cdot c$  or  $x \cdot \frac{b}{ay} \cdot a (\text{provided } a \cdot 0)$ . Substituting this value of x into the second equation gives  $a \cdot \frac{b}{ay} \cdot a \cdot by \cdot d$ ,  $by \cdot c \cdot by \cdot d$ ,  $2by \cdot d \cdot c$ , and  $y \cdot \frac{d \cdot c}{2b}$  (provided  $b \cdot 0$ ). Substituting this into the expression for x gives  $x \cdot \frac{b}{a} \cdot \frac{d \cdot c}{2b} \cdot \frac{e}{a} \cdot \frac{d \cdot c}{2a} \cdot \frac{e}{a} \cdot \frac{c \cdot d}{2a}$ . Thus, the system has the unique solution  $\frac{c \cdot d}{2a} \cdot \frac{d \cdot e}{2b}$  if  $a \cdot 0$  and  $b \cdot 0$ .
- **22.** Solving the first equation for x in terms of y, we have  $ax \cdot by \cdot e \text{ or } x \cdot b = ay \cdot a(\text{provided}a \cdot 0)$ .

Substituting this value of x into the second equation gives c  $\cdot \frac{b}{ay}$   $a \cdot \overline{dy}$   $f_{\cdot}$   $ay' a \cdot \overline{dy}$   $f_{\overline{t}}$  $\cdot \frac{ad \cdot bc'}{a} \quad y' \quad f' \quad \frac{ce}{a}$  and  $y \cdot \frac{a}{ad \cdot bc} \quad \frac{af \cdot ce'}{a} \quad \cdot \frac{af \cdot ce}{ad \cdot bc}$  (provided  $ad \cdot bc \cdot 0$ ). Substituting this into the expression for x gives  $x \cdot \frac{b \cdot af \cdot ce}{a \cdot bc} \cdot \frac{e}{a}$   $\cdot \frac{b \cdot af \cdot ce \cdot e \cdot ad \cdot bc}{a \cdot ad \cdot bc} \cdot \frac{e^{d \cdot bf}}{a \cdot bc}$ . If  $a \cdot 0$ , the system reduces to  $a \cdot ad \cdot bc$ 

 $cd \cdot dy \cdot f$ and so  $y \cdot \frac{e}{b} \frac{f \cdot ed}{a}$ , provided  $b \cdot 0$  and  $c \cdot 0 \cdot$  Thus, if  $a \cdot 0, b \cdot 0, c \cdot 0$ , and  $ad \cdot bc \cdot 0$ , the system has the unique solution  $\frac{ed \cdot bf}{ad \cdot bc} \frac{d}{d \cdot bc}$ 

**23.** Let x and y denote the number of acres of corn and wheat planted, respectively. Then  $x \cdot y \cdot 500$ . Since the cost of cultivating corn is \$42 \cdot acre and that of wheat \$30 \cdot acre and Mr. Johnson has \$18,600 available for cultivation, we have  $42x \cdot 30y \cdot 18,600$ . Thus, the solution is found by solving the system of equations

$$\begin{array}{cccc} x \cdot & y \cdot & 500 \\ 42x \cdot & 30y \cdot & 18,600 \end{array}$$

24. Let x be the amount of money Michael invests in the institution that pays interest at the rate of 3% per year and y the amount of money invested in the institution paying 4% per year. Since his total investment is \$2000, we have x ⋅ y ⋅ 2000. Next, since the interest earned during a one-year period was \$72, we have 0 ⋅ 03x ⋅ 0 ⋅ 04y ⋅ 72. Thus, the solution is found by solving the system of equations

$$\begin{array}{cccc} x \cdot & y \cdot & 2000 \\ 0 \cdot & 03x \cdot & 0 \cdot & 04y \cdot & 72 \end{array}$$

25. Let x denote the number of pounds of the \$8 • 00 • lb coffee and y denote the number of pounds of the \$9 • lb coffee. Then x • y • 100. Since the blended coffee sells for \$8 • 60 • lb, we know that the blended mixture is worth 8 • 60 • 100 • • \$860. Therefore, 8x • 9y • 860. Thus, the solution is found by solving the system of equations

$$\begin{array}{ccc} x \cdot & y \cdot & 100 \\ 8x \cdot & 9y \cdot & 860 \end{array}$$

**26.** Let the amount of money invested in the bonds yielding 4% be *x* dollars and the amount of money invested in the bonds yielding 5% be *y* dollars. Then  $x \cdot y \cdot 30,000$ . Also, since the yield from both investments totals \$1320, we have  $0 \cdot 04x \cdot 0 \cdot 05y \cdot 1320$ . Thus, the solution to the problem can be found by solving the system of equations

$$\begin{array}{cccc} x \cdot & y \cdot & 30,000 \\ 0 \cdot & 04x \cdot & 0 \cdot & 05y \cdot & 1320 \end{array}$$

27. Let x denote the number of children who ride the bus during the morning shift and y the number of adults who ride the bus during the morning shift. Then x • y • 1000. Since the total fare collected is \$1300, we have 0• 5x • 1• 5y • 1300. Thus, the solution to the problem can be found by solving the system of equations

$$\begin{array}{cccc} x \cdot & y \cdot & 1000 \\ 0 \cdot & 5x \cdot & 1 \cdot & 5y \cdot & 1300 \end{array}$$

28. Let x, y, and z denote the number of one-bedroom units, two-bedroom townhouses, and three-bedroom townhouses, respectively. Since the total number of units is 192, we have x • y • z • 192. Next, the number of family units is equal to the number of one-bedroom units, and this implies that y • z • x, or x • y • z • 0. Finally, the number of one-bedroom units is three times the number of three-bedroom units, and this implies that x • 3z, or x • 3z • 0. Summarizing, we have the system

**29.** Let *x* and *y* denote the costs of the ball and the bat, respectively. Then

<i>x</i> •	<i>y</i> •	110	or	x	•	У	·	110
	<i>x</i> •		01	• x	•	у	•	100

**30.** Let x and y denote the amounts of money invested in projects A and B, respectively. Then

$$\begin{array}{cccc} x \cdot & y \cdot & 70,000 \\ x \cdot & y \cdot & 20,000 \end{array}$$

31. Let x be the amount of money invested at 3% in a savings account, y the amount of money invested at 4% in mutual funds, and z the amount of money invested at 6% in bonds. Since the total interest was \$10,800, we have 0
• 03x • 0• 04y • 0• 06z • 10,800. Also, since the amount of Sid's investment in bonds is twice the amount of the investment in the savings account, we have z • 2x. Finally, the interest earned from his investment in bonds was equal to the dividends earned from his money mutual funds, so 0• 04y • 0• 06z. Thus, the solution to the problem can be found by solving the system of equations

32. Let x, y, and z denote the amount to be invested in high-risk, medium-risk, and low-risk stocks, respectively. Since all of the \$400,000 is to be invested, we have x • y • z • 400,000. The investment goal of a return of \$40,000• year leads to 0• 15x • 0• 10y • 0• 06z • 40,000. Finally, the decision that the investment in low-risk stocks be equal to the sum of the investments in the stocks of the other two categories leads to z • x • y• So, we are led to the problem of solving the system

33. The percentages must add up to 100%, so

$x \cdot$	<i>y</i> •	<i>z</i> •	100
<i>x</i> •	у	•	67
x	•	<i>z</i> •	17

- **34.** Let *x*, *y*, and *z* denote the numbers of respondents who answered "yes," "no," and "not sure," respectively. Then we have
- 35. Let x, y, and z denote the number of 100-lb. bags of grade A, grade B, and grade C fertilizers to be produced. The amount of nitrogen required is 18x · 20y · 24z, and this must be equal to 26,400, so we have 18x · 20y · 24z · 26,400. Similarly, the constraints on the use of phosphate and potassium lead to the equations 4x · 4y · 3z · 4900 and 5x · 4y · 6z · 6200, respectively. Thus we have the problem of finding the solution to the system

$18x \cdot$	20y ·	$_{24z}$ .	26,400	(nitrogen)
$4x \cdot$	$4y \cdot$	3z ·	4900	(phosphate)
$5x \cdot$	$4y \cdot$	6z ·	6200	(potassium).

- **36.** Let *x* be the number of tickets sold to children, *y* the number of tickets sold to students, and *z* the number of tickets sold to adults at that particular screening. Since there was a full house at that screening, we have  $x \cdot y \cdot z \cdot 900$ . Next, since the number of adults present was equal to one-half the number of students and children present, we have  $z \cdot \frac{12}{2} \cdot x \cdot y \cdot .$ Finally,thereceiptstotaled\$5600,andthisimpliesthat $4x \cdot 6y \cdot 8z \cdot 5600$ .Summarizing,we have the system
  - $\begin{array}{cccc} x \cdot & y \cdot & z \cdot & 900 \\ x \cdot & y \cdot & 2z \cdot & 0 \\ 4x \cdot & 6y \cdot & 8z \cdot & 5600 \end{array}$
- 37. Let x, y, and z denote the number of compact, intermediate, and full-size cars to be purchased, respectively. The cost incurred in buying the specified number of cars is 18,000x · 27,000y · 36,000z. Since the budget is \$2 · 25 million, we have the system

18,000x ·	27,000 $y$ ·	36,000 $z$ ·	2,250,000
<i>x</i> •	2y	•	0
<i>x</i> •	у•	<i>z</i> •	100

38. Let x be the amount of money invested in high-risk stocks, y the amount of money invested in medium-risk stocks, and z the amount of money invested in low-risk stocks. Since a total of \$200,000 is to be invested, we have x • y • z • 200,000. Next, since the investment in low-risk stocks is to be twice the sum of the investments in high- and medium-risk stocks, we have z • 2 • x • y • . Finally, the expected return of the three investments is given by 0 • 15x • 0 • 10y • 0 • 06z and the goal of the investment club is that an average return of 9% be realized on the total investment. If this goal is realized, then 0 • 15x • 0 • 10y • 0 • 06z • 0 • 09 • x • y • z • . Summarizing, we have the system of equations

**39.** Let *x* be the number of ounces of Food I used in the meal, *y* the number of ounces of Food II used in the meal, and *z* the number of ounces of Food III used in the meal. Since 100% of the daily requirement of proteins, carbohydrates, and iron is to be met by this meal, we have the system of linear equations

$10x \cdot$	6y •	8z ·	100
$10x \cdot$	12y ·	6z ·	100
$5x \cdot$	$4y \cdot$	12z ·	100

**40.** Let *x*, *y*, and *z* denote the amounts of money invested in stocks, bonds, and the money market, respectively. Then we have

*z* • 100,000 (the investments total \$100,000) *x* • v •  $0 \cdot 12x \cdot 0 \cdot 08y \cdot 0 \cdot 04z \cdot$ 10,000 (the annual income is \$10,000)  $z \cdot 0 \cdot 20x \cdot 0 \cdot 10y$  (the investment mix) 100.000 *z* • **x** • v •  $12x \cdot$  $8v \cdot$  $4z \cdot 1.000.000$  $20x \cdot 10y \cdot 100z \cdot$ 0

**41.** Let *x*, *y*, and *z* denote the numbers of front orchestra, rear orchestra, and front balcony seats sold for this performance, respectively. Then we have

Equivalently,

 $x \cdot y \cdot z \cdot 1000$ (tickets sold total 1000) $80x \cdot 60y \cdot 50z \cdot 62,800$ (total revenue) $x \cdot y \cdot 2z \cdot 400$ (relationship among different types of tickets)

**42.** Let *x*, *y*, and *z* denote the numbers of dozens of sleeveless, short-sleeve, and long-sleeve blouses produced per day, respectively. Then we have

$$9x \cdot 12y \cdot 15z \cdot 4800 22x \cdot 24y \cdot 28z \cdot 9600 6x \cdot 8y \cdot 8z \cdot 2880$$

**43.** Let *x*, *y*, and *z* denote the numbers of days spent in London, Paris, and Rome, respectively. Then we have
