A note about the correlation between CPA competencies and the end-of-chapter exercises and problems.

The CPA competencies are divided into enabling competencies and terminal competencies. Unless otherwise specified, the terminal competency being tested by the end-of-chapter material in this course is cpa-t003 (Management Accounting). The enabling competency being tested will differ between questions. The following questions test enabling competency cpa-e002 Problem-Solving and Decision-Making:

BE2.5, BE2.6, BE2.7, BE2.8, BE2.11, BE2.12, BE2.13, D2.16, D2.17, E2.20, E2.24, E2.25, E2.27, E2.28, E2.29, E2.30, E2.31, E2.32, E2.33, E2.34, E2.35, E2.36, E2.38, E2.39, P2.40A, P2.41A, P2.42A, P2.43A, P2.44A, P2.45A, P2.46A, P2.47A, P2.48A, P2.49B, P2.50B, P2.51B, P2.52B, P2.53B, P2.54B, P2.55B, P2.56B, P2.57B, P2.58B

BRIEF EXERCISE 2.4

Indirect labour is a variable cost because it increases in total directly and proportionately with the change in the activity level: $10,000 ÷ 2,000 units = $5 and $20,000 ÷ 4,000 units = $5.

Supervisory salaries are a fixed cost because they remain the same in total regardless of changes in the activity level: $5,000 at both levels.

Maintenance is a mixed cost because it increases in total but not proportionately with changes in the activity level: $4,000 ÷ 2,000 units = $2 and $7,000 ÷ 4,000 units = $1.75.

BRIEF EXERCISE 2.11

(a) Direct labour costs = prime costs + conversion costs – total manufacturing costs
Direct labour = $195,000 + $140,000 – $270,000 = $65,000

Direct material costs = prime costs – direct labour costs
Direct material costs = $195,000 – $65,000 = $130,000

Manufacturing overhead costs = conversion costs – direct labour costs
Manufacturing overhead costs = $140,000 – $65,000 = $75,000

(b) Total costs of production = direct material + direct labour + overhead
= $130,000 + $65,000 + $75,000 = $270,000

Product costs:
Blank CDs (DM)
Depreciation of CD image burner (MO)
Salary of factory manager (MO)
Factory supplies used (MO)

Salaries of factory maintenance employees (MO)

*DO IT! 2.*15

Variable costs: Indirect labour, direct labour, and direct materials
Fixed costs: Property taxes and depreciation
Mixed costs: Utilities and maintenance

*DO IT! 2.*16

(a) Variable cost: ($18,750 – $16,200) ÷ (10,500 – 8,800) = $1.50 per unit
Fixed cost: $18,750 – ($1.50 × 10,500 units) = $3,000
or $16,200 – ($1.50 × 8,800 units) = $3,000

(b) Total estimated cost to produce 8,500 units:
= $3,000 + ($1.50 × 8,500) = $15,750

Total estimated cost cannot be calculated because 8,500 units are out of the relevant range of 8,800 to 10,500 units.

Product costs are not expensed until the goods are sold and are reflected in the cost of goods sold account. Period costs are recognized as an expense when incurred.

Variable costs	**Vary in total directly and proportionately with changes in the activity level but remain constant on a per-unit basis**
Fixed costs	**Remain constant in total regardless of changes in the activity level but vary on a per-unit basis**
Mixed costs	**Contain both a variable and fixed cost element. They change in total but not proportionately with changes in the activity level and vary both in total and on a per-unit basis**

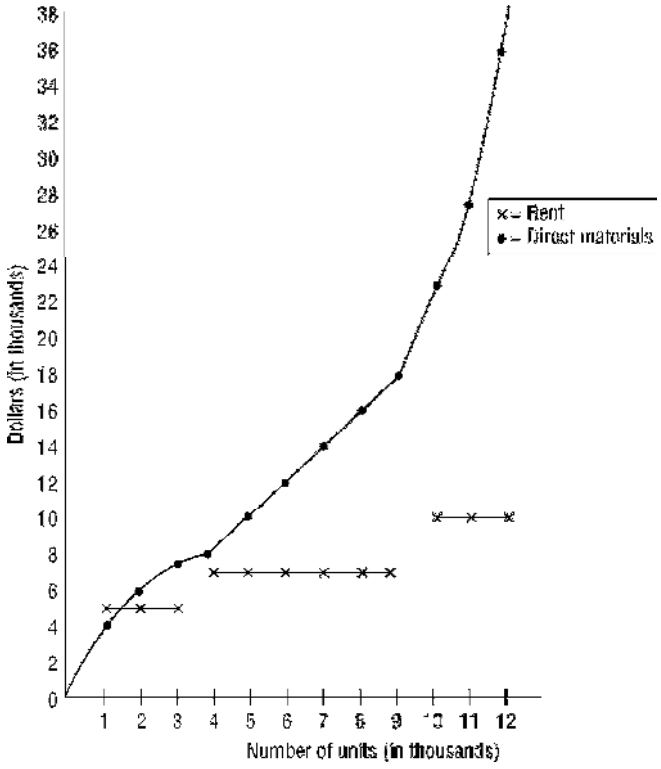
(b) Using these criteria as a guideline, the classification is as follows:

Direct materials	**Variable**	**Rent**	**Fixed**
Direct labour	**Variable**	**Maintenance**	**Mixed**
Utilities	**Mixed**	**Supervisory salaries**	**Fixed**

Solutions Manual © 2018 John Wiley & Sons Canada, Ltd. Unauthorized copying, distribution, or transmission of this page is prohibited

EXERCISE 2.24

(a)



(b) The relevant range is 4,000 – 9,000 units of output since a straight-line relationship exists for both direct materials and rent within this range.

(c) Variable cost per unit within the relevant range: (4,000 – 9,000 units)

$$= \frac{\text{Cost}}{\text{Units}}$$

$$= \frac{\$10,000^*}{5,000^*} = \$2 \text{ per unit}$$

***Any costs and units within the relevant range could have been used to calculate the same unit cost of $2.**

(d) Fixed cost within the relevant range (4,000 to 9,000 units) = $7,000.

Solutions Manual © 2018 John Wiley & Sons Canada, Ltd. Unauthorized copying, distribution, or transmission of this page is prohibited

EXERCISE 2.25

(a) Maintenance Costs:

($4,900 – $2,500) ÷ (700 – 300) = $2,400 ÷ 400 =
$6.00 variable cost per machine hour

	700 Machine Hours	300 Machine Hours
Total costs	$4,900	$2,500
Less: Variable costs		
700 × $6.00	4,200	
300 × $6.00		1,800
Total fixed costs	$ 700	$ 700

Thus, maintenance costs are $700 per month plus $6.00 per machine hour.

2.	Fuel used in delivery trucks	Variable
3.	Straight-line depreciation on factory building	Fixed

8.	Insurance on buildings	Fixed
9.	Hourly wages of furniture craftspeople	Variable
10.	Salaries of factory supervisors	Fixed
11.	Utilities expense	Mixed
12.	Telephone bill	Mixed

EXERCISE 2.27

(a) Maintenance Costs:

$$\frac{\$5{,}000 - \$2{,}750}{8{,}000 - 3{,}500} = \frac{\$2{,}250}{4{,}500}$$

= $0.50 variable cost per machine hour

	Activity Level	
	High	Low
Total cost	$5,000	$2,750
Less: Variable costs		
8,000 × $.50	4,000	
3,500 × $.50		1,750
Total fixed costs	$1,000	$1,000

Thus, maintenance costs are $1,000 per month plus $0.50 per machine hour.

EXERCISE 2.28 (Continued)

(b) Variable costs to produce 3,000 units = $7,500 + $15,000 + $4,500
= $27,000

Variable cost per unit = $27,000 ÷ 3,000 units
= $9 per unit

Variable cost portion of mixed cost = Total cost – Fixed portion

Utilities:
Variable cost to produce 3,000 units = $1,800 – $300
= $1,500

Variable cost per unit = $1,500 ÷ 3,000 units
= $0.50 per unit

Maintenance:
Variable cost to produce 3,000 units = $1,100 – $200
= $900

Variable cost per unit = $900 ÷ 3,000 units
= $0.30 per unit

Total variable cost per unit = $9.00 + $0.50 + $0.30
= $9.80

Fixed cost element = $1,000 + $1,800 + $2,400 +
$300 + $200
= $5,700

Cost to produce 5,000 units = ($9.80 × 5,000) + $5,700

(a) Raw Materials account:
5,000 units purchased; 4,650 units used = 350 units remaining
350 units x $8 each = $2,800

Work in Process account:
4,600 units were used in manufacturing; 90% in completed autos
(4,600 × 10%) × $8 = $3,680

Finished Goods account:
4,600 x 90% completed; 75% of completed autos sold
(4,600 × 90% × 25%) × $8 = $8,280

Cost of Goods Sold account:
4,600 x 90% completed; 75% of completed autos sold
(4,600 × 90% × 75%) × $8 = $24,840

Subject: Statement Presentation of Accounts

Two accounts will appear on the income statement. Cost of Goods Sold will be deducted from net sales in determining gross profit. Selling Expenses will be shown under operating expenses and will be deducted from gross profit in determining net income. Sometimes, the calculation for Cost of Goods Sold is shown on the income statement. In these cases, the balance in Finished Goods inventory would also be shown on the income statement.

The other accounts associated with the head lamps are inventory accounts that contain end-of-period balances. Thus, they will be reported under inventories in the current assets section of the balance sheet in the following order: finished goods, work in process, and raw materials.

(3) $3 × 2,500 = $7,500
(4) $8,400 ÷ 12 = $700

PROBLEM 2.51B

(a) Case 1

Total manufacturing costs = (a)
(a) = $6,300 + $3,000 + $6,000 = $15,300

Ending work in process inventory = (b)
$15,300 + $1,000 – (b) = $15,800
(b) = $15,300 + $1,000 – $15,800 = $500

Beginning finished goods inventory = (c)
(c) + $15,800 = $18,300
(c) = $18,300 – $15,800 = $2,500

Cost of goods sold = (d)
(d) = $18,300 – $1,200 = $17,100

Gross profit = (e)
(e) = ($22,500 – $1,500) – $17,100 = $3,900

Net Income = (f)
(f) = $3,900 – $2,700 = $1,200

Case 2

Direct materials used = (g)
(g) + $4,000 + $5,000 = $16,000
(g) = $16,000 – $4,000 – $5,000 = $7,000

Beginning work in process inventory = (h)
$16,000 + (h) – $2,000 = $20,000
(h) = $20,000 + $2,000 – $16,000 = $6,000

Goods available for sale = (j)
(j) = $20,000 + $5,000 = $25,000

Cost of goods sold = (k)
(k) = $25,000 – $2,500 = $22,500

PROBLEM 2.51B (Continued)

(Note: Item (i) can only be solved after items (j) and (k) are solved.)
Sales = (i)
((i) – $1,200) – (k) = $6,000
((i) – $1,200) – $22,500 = $6,000
(i) = $1,200 + $22,500 + $6,000 = $29,700

Operating expenses = (l)
$6,000 – (l) = $2,200
(l) = $3,800

PROBLEM 2.58B

Abbreviations used:
Let CON = Conversion cost
Let FOH = Factory overhead costs
Let PRI = Prime cost
Let TMC = Total manufacturing costs
BDMI is Beginning Direct Materials Inventory
EDMI is Ending Direct Materials Inventory

(a) Calculations:

Gross profit = $900,000 × 20% = $180,000
Cost of goods sold = $900,000 – $180,000 = $720,000

CON = $360,000 + (40% × CON)
(0.6 × CON) = $360,000
CON = $600,000
FOH = $600,000 – $360,000 = $240,000

PRI = 70% × TMC
DM + DL = 0.70(DM + DL + FOH)
1.0DM – 0.70DM = 0.70(DL + FOH) – DL
0.30DM = 0.70($360,000 + $240,000) – $360,000
DM = $200,000

TMC = $200,000 + $360,000 + $240,000 = $800,000

Ending WIP = 10% × TMC = 0.10 × $800,000 = $80,000

COGM = BWIP + TCM – EWIP = $68,000 + $800,000 – $80,000 = $788,000

BFI + COGM – EFI = COGS
EFI = $30,000 + $788,000 – $720,000 = $98,000 (1)

EDMI = BDMI + DM Purchases – DM Used
EDMI = $32,000 + $320,000 – $200,000 = $152,000

[4] $40,000 – $12,000 = $28,000
[5] Cost of goods manufactured = $28,000 from point (4)
[6] ($2,000 + $20,000 + $22,000) – $28,000 = $16,000

CASE 2.64

(a) The stakeholders in this situation are:

- **The users of Robbin Industries' financial statements**
- **Wayne Terrago, controller**
- **The vice-president of finance**
- **The president of Robbin Industries**

(b) The ethical issues in this situation pertain to the adherence to sound and acceptable accounting principles. Intentional violation of current standards in order to satisfy a practical short-term personal or company need, thereby creating misleading financial statements, would be unethical. However, selecting one acceptable method of accounting and reporting among various acceptable methods is not necessarily unethical.

(c) Ethically, the management of Robbin Industries should be trying to report the financial condition and results of operations as fairly as possible; that is, in accordance with current accounting standards. Wayne should inform management what is acceptable accounting and what is not. The basic concept to be supported in this advertising cost transaction is matching costs and revenues. Normally, advertising costs are expensed in the period in which they are incurred because it is very difficult to associate them with specific revenues. Further, as advertising costs are not incurred to manufacture the product they should not be classified as product costs.

CASE 2.65: "All About You" Activity

There is no one specific correct response. Students should consider the wider implications of the situation, making assumptions as needed.

(a) By eliminating one of the production shifts, the cost of labour could be reduced. However, the shortfall of 1,000 units (11,000 – 10,000) would have to be produced using overtime labour (assuming this is practical). This could result in a higher labour cost per unit than at the 20,000-production level.

Also, it is possible that material costs will increase if the company is no longer able to get volume discounts from its suppliers.

(b) Fixed costs could be reduced by:

- **A partial closure of the plant or consolidating activities to one location in the plant**
- **Subletting a portion of the plant**
- **Closing the plant completely and outsourcing production of the 11,000 units**

(c) Other options for the company to increase profits are to

- **consider utilizing the excess production capacity created by the bankruptcy to produce another product**
- **diversify their customer base**
- **reduce discretionary expenditures**
- **negotiate improved prices from suppliers**
- **research assistance packages from provincial or federal governments**

SOLUTION TO WATERWAYS CONTINUING PROBLEM WCP.2

(a) Direct labour:

($176,000 – $148,000) ÷ ($32,000 – $24,000) = 3.5

	Activity Level	
	High	Low
Total cost	$176,000	$148,000
Less: Variable costs		
32,000 × 3.5	112,000	
24,000 × 3.5		84,000
Total fixed costs	$ 64,000	$ 64,000

The cost formula is: $64,000 + 3.5X.

Hours of operation:

($170,000 – $145,000) ÷ (700 – 500) = $125 per hour

	Activity Level	
	High	Low
Total cost	$170,000	$145,000
Less: Variable costs		
700 × $125	87,500	
500 × $125		62,500
Total fixed costs	$ 82,500	$ 82,500

The cost formula is: $82,500 + $125X.

WCP.2 (Continued)

(b) First determine the direct labour cost for the month:

$70,000 x (100% - 60%) = $28,000

Then, if we substitute the actual values of the activity bases from the current month we would get the following estimates:

Labour dollars: $64,000 + (3.5 × $28,000) = $162,000

Hours of operation: $82,500 + ($125 × 600) = $157,500

Actual manufacturing overhead for the month is calculated as follows:

Total manufacturing costs (given)		**$315,000**
Less: Direct materials [(1)]	**$132,000**	
Direct labour [(2)]	**28,000**	**160,000**
Manufacturing overhead		**$155,000**

[(1)] Direct materials	
Raw materials inventory, beg.	**$35,000**
Plus: raw material purchases	**191,000**
Raw materials available for use	**226,000**
Less: Raw materials inventory, end	**50,000**
Raw materials used in production	**176,000**
Less: indirect materials (25%)	**44,000**
Direct materials used in production	**$132,000**

[(2)] Total salaries and wages	**$70,000**
Less: Indirect wages (60%)	**42,000**
Direct labour used in production	**$28,000**

As the actual manufacturing overhead was $155,000 for the month, hours of operation would be the better choice as an activity base for predicting manufacturing overhead.
