Managerial Accounting 2.0 Heisinger and Hoyle

Chapter 2 Solutions

Chapter 2 Solutions

Questions

- 1. Companies that produce unique products or provide unique services, easily distinguished from other products or services, are likely to use a job costing system. Examples include custom home builders, auto mechanics, and tax accountants. Companies that produce identical units of product in batches are likely to use a process costing system. Examples include producers of soft drinks, snack foods (chips, cookies, and the like), milk, and paint.
- 2. The materials requisition form includes the type, quantity, and cost of materials being requested and placed into production, and the job number where the materials will be used.
- **3.** Job cost sheets accumulate manufacturing costs incurred for each job, and serve as a subsidiary ledger to the Work in Process Inventory account. This form includes the job number, customer name, and manufacturing costs incurred (direct materials, direct labor, and manufacturing overhead applied).
- **4.** A timesheet is used by workers to track the hours spent on each job and includes the employee's name, date, job number, and hours worked for each job.
- **5.** A predetermined overhead rate is used to allocate manufacturing overhead costs to jobs. The term used to describe this process is *overhead applied*.
- **6.** Boeing uses a job costing system to track production costs for each jetliner it produces, including direct materials, direct labor, and manufacturing overhead costs. This information helps management in a variety of ways. Job costing provides cost information that is important in assessing profitability for each jetliner produced, and helps with establishing prices for future customer orders. Job costing also helps in evaluating the inputs required to produce jetliners, and whether the use of these inputs are efficient.

7. *Normal costing system* is the term used to describe a cost system that tracks <u>actual</u> direct materials and *actual* direct labor costs for each job, and charges manufacturing overhead to jobs using a *predetermined overhead rate*.

A predetermined overhead rate is used for several reasons.

- Actual overhead costs can fluctuate from month to month causing high amounts of overhead to be charged to jobs during high cost periods.
 Normal costing smoothes out these fluctuations.
- Actual overhead cost data is typically only available at the end of the month, quarter, or year. Managers do not like to wait for this information to figure out the cost of jobs.
- The price charged to customers is often established based on product cost. Managers want a way to estimate manufacturing overhead—a predetermined overhead rate provides the means to do this.
- Bookkeeping is simplified. The accountant simply uses a predetermined rate to record manufacturing overhead costs.
- **8.** The two important factors to consider when selecting an allocation base are that the base must have some link to overhead costs (that is, must drive overhead costs), and the base must be relatively easy to measure (for example, direct labor hours are easy to measure–simply use timesheets to track this data).
- **9.** Actual manufacturing overhead costs incurred are recorded as a debit to the Manufacturing Overhead account. Manufacturing overhead applied to jobs is recorded as a credit to the Manufacturing Overhead account. The difference between the two amounts is called *overapplied* or *underapplied* overhead.
- **10.** Manufacturing overhead is underapplied when overhead applied is *less* than actual overhead costs incurred, resulting in a debit balance in the Manufacturing Overhead account. Manufacturing overhead is overapplied when overhead applied is *more* than actual overhead costs incurred, resulting in a credit balance in the Manufacturing Overhead account.
- 11. The first option is to close the Manufacturing Overhead account to Cost of Goods Sold. This is appropriate when the balance is not significant (i.e., immaterial). The second option is to close the Manufacturing Overhead account to three different accounts—Work in Process Inventory, Finished Goods Inventory, and Cost of Goods Sold—in proportion to the account balances in each of these accounts. This is appropriate when the Manufacturing Overhead account balance is significant (i.e., material).

- **12.** Although job costing systems in service organizations are similar to job costing systems used by manufacturing companies, differences are as follows:
 - Service organizations tend to use fewer materials.
 - Account names are slightly different—Raw Materials Inventory is called Parts
 Inventory or Supplies, Finished Goods Inventory is not applicable, Cost of Goods
 Sold is called Cost of Services, and Manufacturing Overhead is simply called
 Overhead.
 - Costs are often tracked by customer (or client) rather than by product.
- 13. It is important for movie studios to have cost information for each movie, because stakeholders (actors, directors, etc.) are often paid based on the profit derived from the movie. Cost information is necessary to calculate the profitability of each movie, so a job costing system is used to track this information.
- **14.** A job costing system tracks actual direct materials, direct labor, and manufacturing overhead costs for each job. Deducting these actual production costs from sales revenue provides a profitability measure for each job. Management often compares actual profit to estimated profit for each job to assess whether profit goals were achieved.

Brief Exercises

15. Product Costs at Custom Furniture Company

Dan is concerned with the lack of profits shown on last month's income statement. The price for each piece of furniture is based on a 70 percent markup of estimated product costs, but the income statement shows lower profits than expected.

Leslie proposed to compare actual costs to estimated costs for the three costliest jobs, and evaluate whether the estimates were reasonable based on this comparison.

16. Job Costing Versus Process Costing

1.	Process costing	5.	Job costing
2.	Job costing	6.	Process costing
3.	Process costing	7.	Process costing
4.	Job costing	8.	Job costing

17. Job Costing Versus Process Costing

1.	Job costing	5.	Job costing
2.	Process costing	6.	Process costing
3.	Job costing	7.	Process costing
4.	Process costing	8.	Job costing

18. Recording Purchase and Transfer of Raw Materials in T Accounts

a. and b.

Raw Materials Inventory		Wor	k in Proc	ess Inventory		
(Oct. 5)	15,000	6,000	(Oct. 8)	(Oct. 8)	6,000	
		1,000	(Oct. 8) (Oct. 10)			
		•				•
Ma	nufactur	ing Ove	erhead		Account	s Payable
(Oct. 10)	1,000					15,000 (Oct. 5)

19. Calculating Predetermined Overhead Rate

The predetermined overhead rate is calculated as follows:

Predetermined <u>Estimated overhead costs</u>
overhead rate <u>Estimated activity in allocation base</u>

<u>\$8,000,000 estimated overhead costs</u> 20,000 direct labor hours

= \$400 per direct labor hour

Each job will be charged \$400 in manufacturing overhead for each direct labor hour worked.

20. Service Organization Accounts

<u>Manufacturing</u>	<u>Service</u>
1. Raw Materials Inventory	Parts Inventory (or Supplies)
2. Work in Process Inventory	Work in Process (if applicable)
3. Finished Goods Inventory	Not applicable
4. Cost of Goods Sold	Cost of Services (or other expense
	accounts)
5. Manufacturing Overhead	Overhead (or Service Overhead)

21. Evaluating Profitability of Jobs

The company uses a 70 percent markup on estimated product costs to establish the sales price for each job. However, actual results on the income statement showed significantly less profit than the 70 percent would provide. The accountant at Custom Furniture Company suggested comparing actual costs to estimated costs to evaluate whether actual costs were in line with the initial estimates.

This analysis showed that actual direct materials costs were significantly higher than originally estimated resulting in lower profitability than expected for each job.

Exercises: Set A

22. Raw Materials Inventory Journal Entries

a. 1.	Raw Materials Inventory Accounts Payable	55,000	55,000
2.	Work in Process Inventory Raw Materials Inventory	48,000	48,000
3.	Manufacturing Overhead Raw Materials Inventory	14,000	14,000

b.

Raw Materials Inventory beg. bal. 45,000 (1) 55,000 48,000 (2) 14,000 (3)			
beg. bal.	45,000		
(1)	55,000	48,000	(2)
		14,000	(3)
end. bal.	38,000		

23. Work in Process Inventory Related Journal Entries

n	
•	

1.	Work in Process Inventory Raw Materials Inventory	340,000	340,000
2.	Work in Process Inventory Wages Payable	810,000	810,000
3.	Work in Process Inventory Manufacturing Overhead	660,000	660,000
4.	Finished Goods Inventory 1,9 Work in Process Inventory	960,000	1,960,000

b.

	Work in Process Inventory				
	beg.	bal. 900,000			
	(1)	340,000	1,960,000	(4)	
	(2)	810,000			
	(3)	660,000			
Ī	end. bal. 750,000				

24. Cost of Goods Sold Journal Entries

a.

1.	Finished Goods Inventory Work in Process Inventory	445,000	445,000
2.	Cost of Goods Sold Finished Goods Inventory	470,000	470,000

b.

Finished Goods Inventory				
beg. bal. 650,000				
(1)	445,000	470,000	(2)	
end. b	oal. 625,000			

25. Income Statement (with cost of goods sold adjustment)

Yamamoto, Inc. Income Statement Year Ended December 31

Sales	\$3,050,000
Cost of goods sold before adjustment for underapplied overhead	\$700,000
Adjustment for underapplied overhead*	23,000
Cost of goods sold	723,000
Gross profit	\$2,327,000
Less operating (nonmanufacturing) expenses:	
Selling	575,000
General and administrative	330,000
Operating profit	<u>\$1,422,000</u>

^{*} This represents the amount of overhead underapplied to jobs and closed out to Cost of Goods Sold at the end of the year.

26. Manufacturing Overhead Allocation Base and Calculating the Cost of Jobs

a. The predetermined overhead rate is calculated as follows:

Predetermined overhead rate Estimated overhead costs

Estimated activity in allocation base

Using Direct Labor Hours:

\$3,000,000 estimated overhead costs 50,000 direct labor hours

\$60.00 per direct labor hour

Using Direct Labor Costs:

= \$3,000,000 estimated overhead costs \$600,000 direct labor cost

= \$\frac{\\$5.00 \text{ per direct labor dollar cost}}{\text{labor cost}}\$ (or 500% of direct labor cost)

Using Machine Hours:

\$3,000,000 estimated overhead costs 80,000 machine hours

= \$37.50 per machine hour

- b. The goal is to allocate overhead using an allocation base that drives (or causes) overhead costs. If Brenner's production process is highly mechanized, overhead costs are likely driven by machine use. The more machine hours used, the higher the overhead costs incurred. Thus, there is a link between machine hours and overhead costs and using machine hours as an allocation base is preferable. Machine hours are also easily tracked, making implementation relatively simple.
- **c.** Three different cost calculations are required:

	Direct Labor	Direct Labor	Machine
	<u>Hours</u>	Cost	Hours
Direct materials	\$ 6,000	\$ 6,000	\$ 6,000
Direct labor	4,000	4,000	4,000
Manufacturing overhead	18,000*	20,000**	26,250***
Total cost of Job #128	\$28,000	<u>\$30,000</u>	\$36,250

^{* \$18,000 = \$60} rate x 300 direct labor hours

^{**} \$20,000 = \$5 rate (or 500 percent) x \$4,000 direct labor cost

^{*** \$26,250 = \$37.50} rate x 700 machine hours

Exercises: Set B

27. Raw Materials Inventory Journal Entries

a. 1.	Raw Materials Inventory Accounts Payable	50,000	50,000
2.	Work in Process Inventory Raw Materials Inventory	17,000	17,000
3.	Manufacturing Overhead Raw Materials Inventory	8,000	8,000

b.

(3)	200,000			
end. bal. 320,000				

29. Cost of Goods Sold Journal Entries

a.

1.	Finished Goods Inventory Work in Process Inventory	17,000	17,000
2.	Cost of Goods Sold Finished Goods Inventory	14,000	14,000

b.

Finished Goods Inventory			
beg. bal.			
(1)	17,000	14,000	(2)
end. bal.	28,000		

30. Income Statement (with cost of goods sold adjustment)

Milan Company Income Statement Year Ended December 31

Sales	\$5,000,000
Cost of goods sold before adjustment for overapplied overhead	\$2,900,000
Adjustment for overapplied overhead*	(109,000)
Cost of goods sold	2,791,000
Gross profit	\$2,209,000
Less operating (nonmanufacturing) expenses:	
Selling	825,000
General and administrative	570,000
Operating profit	<u>\$ 814,000</u>

^{*} This represents the amount of overhead overapplied to jobs and closed out to Cost of Goods Sold at the end of the year.

31. Manufacturing Overhead Allocation Base and Calculating the Cost of Jobs

a. The predetermined overhead rate is calculated as follows:

Predetermined overhead costs
overhead rate Estimated overhead costs
Estimated activity in allocation base

Using Direct Labor Hours:

\$800,000 estimated overhead costs
10,000 direct labor hours

= \$80 per direct labor hour

Using Direct Labor Costs:

= \$800,000 estimated overhead costs \$200,000 direct labor cost

= <u>\$4 per direct labor dollar cost</u> (or 400% of direct labor cost)

Using Machine Hours:

\$800,000 estimated overhead costs
4,000 machine hours

= \$200 per machine hour

- **b.** The goal is to allocate overhead using an allocation base that drives (or causes) overhead costs. If Kimmel's production process involves more direct labor than automated processes, overhead costs are likely driven by direct labor. The more direct labor hours used, the higher the overhead costs incurred. Thus, there is a link between direct labor hours (or direct labor costs) and overhead costs, and using direct labor as an allocation base is preferable. Direct labor hours and costs are also easily tracked, making implementation relatively simple.
- **c.** Three different cost calculations are required:

	Direct Labor	Direct Labor	Machine
	<u>Hours</u>	Cost	<u>Hours</u>
Direct materials	\$1,750	\$1,750	\$1,750
Direct labor	860	860	860
Manufacturing overhead	<u>6,400</u> *	<u>3,440</u> **	4,000***
Total cost of Job #15B	<u>\$9,010</u>	<u>\$6,050</u>	<u>\$6,610</u>

^{*} $$6,400 = $80 \text{ rate } \times 80 \text{ direct labor hours}$

^{** \$3,440 = \$4} rate (or 400 percent) x \$860 direct labor cost

^{*** \$4,000 = \$200} rate x 20 machine hours

Problems

32. Actual and Applied Manufacturing Overhead

a.	Manufacturing Overhead	95,000	
	Raw Materials Inventory		40,000
	Wages Payable		36,000
	Prepaid Rent		6,000
	Accumulated Depreciation, I	Equipment	13,000

b. Work in Process Inventory 122,400*

Manufacturing Overhead 122,400

c.

Manufacturing Overhead			
(a)	95,000	122,400	(b)
()	,	,	(-)
		27,400	end. bal.

d. Manufacturing Overhead has a credit balance of \$27,400 as shown in part c, and thus is overapplied. The entry to close Manufacturing Overhead is:

Manufacturing Overhead 27,400 Cost of Goods Sold 27,400

^{* \$122,400 = \$24} x 5,100 machine hours

33. Actual and Applied Manufacturing Overhead

a.	Manufacturing Overhead 637,500)
	Raw Materials Inventory	335,000
	Wages Payable	275,000
	Accumulated Depreciation, Factory	18,000
	Utilities Payable (or Accounts Payable)	9,500

b. Work in Process Inventory 600,000*

Manufacturing Overhead 600,000

c.

Manufacturing Overhead				
(a)	637,500	600 000	(b)	
(4)	057,500	000,000	(0)	
end.	bal. 37,500			

d. Manufacturing Overhead has a debit balance of \$37,500 as shown in part c, and thus is underapplied. The entry to close Manufacturing Overhead is:

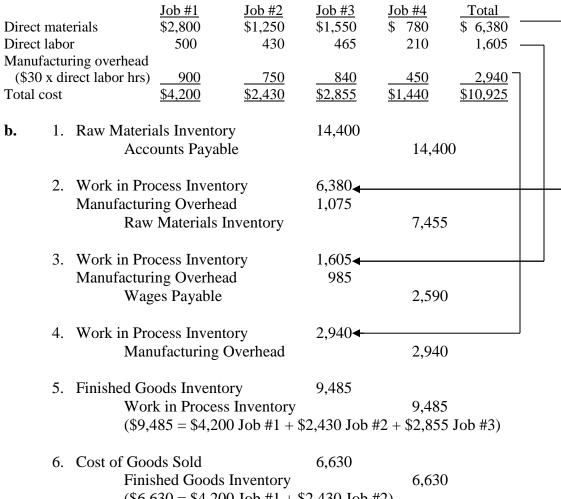

Cost of Goods Sold 37,500

Manufacturing Overhead 37,500

^{*} \$600,000 = \$2 (or 200%) x \$300,000 direct labor cost

34. Calculating the Cost of Jobs, Making Journal Entries, and Preparing an Income **Statement**

(\$6,630 = \$4,200 Job #1 + \$2,430 Job #2)

Accounts Receivable

9,500

Sales

9,500

(\$9,500 = \$6,000 Job #1 + \$3,500 Job #2)

c. Fit Right, Inc. made \$1,070 in gross profit from the sale of Job 2 (\$1,070 = \$3,500revenue - \$2,430 cost). Note that the gross profit is the profit earned before covering selling, general and administrative costs.

34. (continued)

d. Fit Right, Inc.
Income Statement
Month Ended July 31

Sales	\$9,500
Cost of goods sold	6,630
Gross profit	\$2,870
Deduct operating (nonmanufacturing) expenses:	
Selling	1,000
General and administrative	2,200
Operating loss	<u>\$ (330)</u>

35. Calculating the Cost of Jobs, Making Journal Entries, and Preparing an Income Statement

	or uring overhead direct labor cost)	Job 1 \$38,800 7,400 $\frac{11,840}{$58,040}$	Job 2 \$19,300 5,900	Job 3 \$22,500 3,250 5,200 \$30,950	Total \$ 80,600 — 16,550 — 26,480 — \$123,630	
b. 1.	Raw Materials Inve	•	225,000	225,0	000	
2.	Work in Process In Manufacturing Ove Raw Materi	•	80,600 43,500	124,1	100	
3.	Work in Process In Manufacturing Ove Wages Paya	erhead	16,550 4,850	21,40	00

6.		l oods Inventor	58,040 y	58,04	40	
	Accounts Receivab	le	70,000	70,00	00	

c. Dirt Bikes, Inc., made \$11,960 in gross profit from the sale of Job 1 (\$11,960 = \$70,000 revenue - \$58,040 cost). Note that the gross profit is the profit earned before covering selling, general and administrative costs.

d. Dirt Bikes, Inc. Income Statement Month Ended April 30

Sales	\$70,000
Cost of goods sold	<u>58,040</u>
Gross profit	11,960
Less operating (nonmanufacturing) expenses:	
Selling	2,000
General and administrative	5,500
Operating profit	<u>\$ 4,460</u>

36. Calculating the Cost of Jobs and Making Journal Entries for a Service Company

- **c.** Tax Services, Inc., made \$6,800 in gross profit for Job 1 (\$6,800 = \$20,000 revenue -\$13,200 cost), and \$6,040 in gross profit for Job 2 (\$6,040 = \$21,000 revenue -\$14,960 cost). Note that the gross profit is the profit earned before covering selling, general and administrative costs.
- **d.** Jobs 3 and 4 are still in process at the end of the first half of February. The cost for each of these jobs is \$4,840 and \$770, respectively. Thus, total Work in Process is \$5,610.

37. Calculating the Cost of Jobs and Making Journal Entries for a Service Company

a.							
		<u>Job 1</u>	Job 2	Job 3	<u>Total</u>	_	
Direct	labor	\$1,500	\$1,700	\$400	\$3,600		
	e overhead per direct labor hour) Cost	500 \$2,000	600 \$2,300	100 \$500	1,200 \$4,800		
b.	1. Supplies Accounts P	ayable	1,500	1,500)		
	2. Service Overhead Supplies		800	800			
	3. Work in Process Service Overhead Wages Paya	able	3,600 ← 900	4,500)		
	4. Work in Process Service Ove	erhead	1,200◀	1,200)		
	5. Cost of Services Work in Pro	ocess	2,000	2,000)		
	Accounts Receivab Sales Rever		3,000	3,000)		

c. Westley Company made \$1,000 in gross profit for Job #1 (\$1,000 = \$3,000 revenue - \$2,000 cost). Note that the gross profit is the profit earned before covering selling, general and administrative costs.

38. Closing Manufacturing Overhead: Two Approaches

- **a.** The Manufacturing Overhead account has a credit balance of \$90,000. Thus, overhead is overapplied—too much overhead has been applied to jobs.
- **b.** When the balance in the Manufacturing Overhead account is immaterial, the account is typically closed to cost of goods sold. Since overhead is overapplied, cost of goods sold is decreased. The entry is:

Manufacturing Overhead	90,000	
Cost of Goods Sold		90,000

c. When the balance in the Manufacturing Overhead account is material, it should be closed to three different accounts—WIP Inventory, Finished Goods Inventory, and Cost of Goods Sold—in proportion to the account balances in these three accounts. Again, since overhead is overapplied, these three accounts are decreased. The entry is:

Manufacturing Overhead	90,000
Work in Process Inventory	9,000*
Finished Goods Inventory	27,000*
Cost of Goods Sold	54,000*

^{*} Amounts are calculated as follows:

	Account	Percent	Allocation Amount
Account	Balance	of Total	(% x \$90,000)
WIP Inventory	\$ 100,000	10%	\$ 9,000
Finished Goods Inventory	300,000	30%	27,000
Cost of Goods Sold	600,000	60%	54,000
Total	\$1,000,000	100%	\$90,000

39. Closing Manufacturing Overhead: Two Approaches

- **a.** The Manufacturing Overhead account has a debit balance of \$60,000. Thus, overhead is underapplied—not enough overhead has been applied to jobs.
- **b.** When the balance in the Manufacturing Overhead account is immaterial, the account is typically closed to Cost of Goods Sold. Since overhead is underapplied, Cost of Goods Sold is increased. The entry is:

Cost of Goods Sold 60,000 Manufacturing Overhead 60,000

c. When the balance in the Manufacturing Overhead account is material, it should be closed to three different accounts—WIP Inventory, Finished Goods Inventory, and Cost of Goods Sold—in proportion to the account balances in these three accounts. Again, since overhead is underapplied, these three accounts are increased. The entry is:

Work in Process Inventory 6,000*
Finished Goods Inventory 12,000*
Cost of Goods Sold 42,000*
Manufacturing Overhead 60,000

^{*} Amounts are calculated as follows:

	Account	Percent	Allocation Amount
Account	Balance	of Total	(% x \$60,000)
WIP Inventory	\$ 200,000	10%	\$ 6,000
Finished Goods Inventory	400,000	20%	12,000
Cost of Goods Sold	1,400,000	<u>70%</u>	42,000
Total	\$2,000,000	100%	\$60,000

Skill-Building Cases

40. Ethics: Shifting Hours Using Job Costing

- **a.** The fee arrangement for the Anderson job provides for revenues to equal cost plus 50 percent. Because Heston Company is under budget on this job, there is an incentive to charge more time to it and collect additional fees. Since the Hinkle Corporation job revenue is simply \$50,000 regardless of actual cost, there is an incentive to keep costs to a minimum—even if hours must be charged to the wrong job.
- b. Charging time worked on the Hinkle job to the Anderson job is not ethical. It would create problems for management within Heston Company who prepare bids for new jobs based on historical information, and who rely on cost information to make future decisions. In addition, if cost information is falsified as Isabel is proposing, Anderson Company would pay more than its fair share for the work being performed.

Toby should first look to the company's established policies for ethical conflict resolution. If Heston Corporation does not have policies in place or if following the organization's policies does not resolve the conflict, the next step is to discuss the conflict with Toby's immediate superior. However, Toby's immediate supervisor (Isabel) is involved in the conflict, so approaching someone who supervises her would be best. If Isabel's superior is not receptive to Toby's concerns, the next step is to approach top management, or the board of directors of the company.

As stated in the IMA's statement, if the ethical conflict still exists after exhausting all levels of internal review, two additional options exist: (1) "Clarify relevant ethical issues by initiating a confidential discussion with an IMA Ethics Counselor or other impartial advisor to obtain a better understanding of possible courses of action" or (2) "Consult your own attorney as to legal obligations and rights concerning the ethical conflict."

41. Internet Project: Automation and Overhead Allocation

- a. Answers will vary.
- b. When direct labor is the most significant product cost, it is reasonable to assume that manufacturing overhead costs are driven by labor—the more labor being utilized, the higher the cost of overhead. As production processes shift toward automation, labor costs become a smaller part of total production costs, and overhead increases (resulting from increased machine maintenance, utilities, depreciation costs, and the like). Thus, using direct labor or direct labor costs as an allocation base is no longer reasonable. Some other allocation base such as machine hours would be better.

42. Group Project: Labor Costs at General Motors and Toyota

- **a.** Answers will vary. Several possibilities are as follows:
 - 1. GM is unionized and likely pays its workers a higher rate. According to the article, hourly wages for Toyota's workers average \$35 (including benefits). Hourly wages for GM workers average \$81 (including benefits).
 - 2. Toyota's workers may be more efficient than GM's workers.
 - 3. Toyota may have more automation and fewer assembly workers than GM.
 - 4. Toyota's new factory includes state-of-the-art production equipment, while GM's factory is 50 years old and is more difficult to upgrade.
- **b.** Assembly line labor is only one component of production. Other production costs to consider include costs for direct materials and manufacturing overhead items (for example, salaried supervisors, equipment depreciation, and maintenance). As production facilities become increasingly automated, direct labor costs decrease in proportion to total production costs. This makes the evaluation of direct materials and manufacturing overhead costs even more important.

Comprehensive Cases

43. Journal Entries, Closing Manufacturing Overhead, and Preparing an Income Statement

a.

Jansen, Inc. Income Statement Year Ended December 31, 2016

Tear Enaca December 51, 2010	
Sales	\$3,800,000
Cost of goods sold (\$2,570,000 + \$120,000*)	2,690,000
Gross profit	\$1,110,000
Less operating (nonmanufacturing) expenses:	
Selling	430,000
General and administrative	265,000
Operating profit	\$ 415,000

^{* \$120,000} is added to Cost of Goods Sold to reflect the adjustment necessary at year end to close out the Manufacturing Overhead account to Cost of Goods Sold. See entry in part *c*.

e. Companies with overapplied or underapplied overhead use a *normal costing* system of allocating overhead costs to products. Normal costing uses a predetermined overhead rate rather than actual costs to apply overhead costs to products.

At Jansen, Inc., overhead was underapplied for the period, which means overhead costs applied to products during the period were less than actual overhead costs incurred during the period. That is, the company did not apply enough overhead costs to its products during the year. To make up for this lack of overhead costs being recorded, the amount of underapplied overhead is added to cost of goods sold on the income statement.

Mountain Nursery Company Income Statement Year Ended December 31, 2016

Year Ended December 31, 2016	
Sales	\$780,000
Cost of goods sold (\$415,000 – \$21,000*)	394,000
Gross profit	386,000
Less operating (nonmanufacturing) expenses:	
Selling	63,000
General and administrative	18,000
Operating profit	\$305,000

^{* \$21,000} is deducted from Cost of Goods Sold to reflect the adjustment necessary at year end to close out the Manufacturing Overhead account to Cost of Goods Sold. See entry in part *c*.

e. Companies with overapplied or underapplied overhead use a *normal costing* system of allocating overhead costs to products. Normal costing uses a predetermined overhead rate rather than actual costs to apply overhead costs to products.

At Mountain Nursery Company, overhead was overapplied for the period, which means overhead costs applied to products during the period were more than actual overhead costs incurred during the period. That is, the company applied too much in overhead costs to its products during the year. To make up for this excess of overhead costs being recorded, the amount of overapplied overhead is deducted from cost of goods sold on the income statement.
