14 Chapter 2 — LAN Redundancy

Chapter 2 — LAN Redundancy

2.0.1.2 Class Activity – Stormy Traffic ()

Objective

Explain the purpose of the Spanning Tree Protocol (STP) in a switched LAN environment with redundant switch links.

Notes:

- Spanning Tree Protocol (STP) and its variations are the focus of this chapter. This modeling activity is designed to help students realize that a switched network can be shaped using STP or its variations.
- This activity can be completed individually, in small groups, or as a class.

Scenario

It is your first day on the job as a network administrator for a small- to medium-sized business. The previous network administrator left suddenly after a network upgrade took place for the business.

During the upgrade, a new switch was added. Since the upgrade, many employees complain that they are having trouble accessing the Internet and servers on your network. In fact, most of them cannot access the network at all. Your corporate manager asks you to immediately research what could be causing these connectivity problems and delays.

So you take a look at the equipment operating on your network at your main distribution facility in the building. You notice that the network topology seems to be visually correct and that cables have been connected correctly, routers and switches are powered on and operational, and switches are connected together to provide backup or redundancy.

However, one thing you do notice is that all of your switches' status lights are constantly blinking at a very fast pace to the point that they almost appear solid. You think you have found the problem with the connectivity issues your employees are experiencing.

Use the Internet to research STP. As you research, take notes and describe:

- Broadcast storm
- Switching loops
- The purpose of STP
- Variations of STP

Complete the reflection questions that accompany the PDF file for this activity. Save your work and be prepared to share your answers with the class.

Resources

• Internet access to the World Wide Web

Reflection

1. What is a definition of a broadcast storm? How does a broadcast storm develop?

A broadcast storm develops when switches forward traffic out of all ports while looking for a destination for the traffic. It develops when switches continuously forward traffic between themselves without time to block interfaces on the switches to create one good path to the destination.

2. What is a definition of a switching loop? What causes a switching loop?

A switching loop forms when redundancy is present on switches and the paths formed create a circle of delivery. Packets travel endlessly along the redundant paths, particularly with multicast and broadcast traffic. This causes a myriad of traffic on the network, causing hosts to have problems accessing the network.

3. How can you mitigate broadcast storms and switching loops caused by introducing redundant switches to your network?

Implement STP or one of its variations. Create VLANs to limit broadcast domains. Check physical connections to make sure that cabling is correct so that switches are not perpetuating broadcasts and routing loops within your network.

4. What is the IEEE standard for STP and some other STP variations, as mentioned in the hyperlinks provided?

802.1D (STP), 802.1W (RSTP), and 802.1I (MST)

5. In answer to this scenario, what would be your first step (after visually checking your network) to correcting the described network problem?

Three answers would be appropriate for this question.

- A network protocol analyzer could be used to check and map network traffic, thus identifying what kind of network problem is present.
- Removing the new switch and its cables to isolate the problem might be a troubleshooting step.
- Checking each switch to make sure that STP is operational is another possible troubleshooting step.

Identify elements of the model that map to IT-related content:

- Spanning Tree Protocol (STP)
- Broadcast storms
- Switching loops
- IEEE STP standards (802.1D, 802.1S, 802.1I)

2.1.2.10 Lab – Building a Switched Network with Redundant Links

Note: Red font color or Gray highlights indicate text that appears in the instructor copy only.

Topology

Addressing Table

Device	Interface	IP Address	Subnet Mask
S1	VLAN 1	192.168.1.1	255.255.255.0
S2	VLAN 1	192.168.1.2	255.255.255.0
S3	VLAN 1	192.168.1.3	255.255.255.0

Objectives

- Part 1: Build the Network and Configure Basic Device Settings
- Part 2: Determine the Root Bridge
- Part 3: Observe STP Port Selection Based on Port Cost
- Part 4: Observe STP Port Selection Based on Port Priority

Background / Scenario

Redundancy increases the availability of devices in the network topology by protecting the network from a single point of failure. Redundancy in a switched network is accomplished through the use of multiple switches or multiple links between switches. When physical redundancy is introduced into a network design, loops and duplicate frames can occur.

The Spanning Tree Protocol (STP) was developed as a Layer 2 loop-avoidance mechanism for redundant links in a switched network. STP ensures that there is only one logical path between all destinations on the network by intentionally blocking redundant paths that could cause a loop.

In this lab, you will use the **show spanning-tree** command to observe the STP election process of the root bridge. You will also observe the port selection process based on cost and priority.

Note: The switches used are Cisco Catalyst 2960s with Cisco IOS Release 15.0(2) (lanbasek9 image). Other switches and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and output produced might vary from what is shown in the labs.

Note: Make sure that the switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Note: Refer to the Instructor Lab Manual for the procedures to initialize and reload devices.

Required Resources

- 3 Switches (Cisco 2960 with Cisco IOS Release 15.0(2) lanbasek9 image or comparable)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet cables as shown in the topology

Part 1: Build the Network and Configure Basic Device Settings

In Part 1, you will set up the network topology and configure basic settings on the switches.

Step 1: Cable the network as shown in the topology.

Attach the devices as shown in the topology diagram, and cable as necessary.

Step 2: Initialize and reload the switches as necessary.

Step 3: Configure basic settings for each switch.

- a. Disable DNS lookup.
- b. Configure the device name as shown in the topology.
- c. Assign **class** as the encrypted privileged EXEC mode password.
- d. Assign cisco as the console and vty passwords and enable login for console and vty lines.
- e. Configure logging synchronous for the console line.
- f. Configure a message of the day (MOTD) banner to warn users that unauthorized access is prohibited.
- g. Configure the IP address listed in the Addressing Table for VLAN 1 on all switches.
- h. Copy the running configuration to the startup configuration.

Step 4: Test connectivity.

Verify that the switches can ping one another.

Can S1 ping S2?	Yes
Can S1 ping S3?	Yes
Can S2 ping S3?	Yes

Troubleshoot until you are able to answer yes to all questions.

Part 2: Determine the Root Bridge

Every spanning-tree instance (switched LAN or broadcast domain) has a switch designated as the root bridge. The root bridge serves as a reference point for all spanning-tree calculations to determine which redundant paths to block.

An election process determines which switch becomes the root bridge. The switch with the lowest bridge identifier (BID) becomes the root bridge. The BID is made up of a bridge priority value, an extended system ID, and the MAC address of the switch. The priority value can range from 0 to 65,535, in increments of 4,096, with a default value of 32,768.

Step 1: Deactivate all ports on the switches.

```
S1 (config) # interface range f0/1-24, g0/1-2
S1 (config-if-range) # shutdown
S1 (config-if-range) # end
S2 (config) # interface range f0/1-24, g0/1-2
S2 (config-if-range) # shutdown
S2 (config-if-range) # end
S3 (config) # interface range f0/1-24, g0/1-2
S3 (config-if-range) # shutdown
S3 (config-if-range) # end
```

Step 2: Configure connected ports as trunks.

```
S1(config)# interface range f0/1-4
S1(config-if-range)# switchport mode trunk
S1(config-if-range)# end
```

```
S2(config)# interface range f0/1-4
S2(config-if-range)# switchport mode trunk
S2(config-if-range)# end
```

```
S3(config) # interface range f0/1-4
S3(config-if-range) # switchport mode trunk
S3(config-if-range) # end
```

Step 3: Activate ports F0/2 and F0/4 on all switches.

```
S1(config) # interface range f0/2, f0/4
```

```
S1 (config-if-range) # no shutdown
S1 (config-if-range) # end
S2 (config) # interface range f0/2, f0/4
S2 (config-if-range) # no shutdown
S2 (config) # interface range f0/2, f0/4
S3 (config) # interface range f0/2, f0/4
S3 (config-if-range) # no shutdown
S3 (config-if-range) # end
```

Step 4: Display spanning tree information.

S1# show spanning-tree

Issue the **show spanning-tree** command on all three switches. The Bridge ID Priority is calculated by adding the priority value and the extended system ID. The extended system ID is always the VLAN number. In the example below, all three switches have equal Bridge ID Priority values (32769 = 32768 + 1, where default priority = 32768, VLAN number = 1); therefore, the switch with the lowest MAC address becomes the root bridge (S2 in the example).

Note: The default STP mode on the 2960 switch is Per VLAN Spanning Tree (PVST).

In the diagram below, record the Role and Status (Sts) of the active ports on each switch in the Topology.

The spanning tree algorithm (STA) uses the root bridge as the reference point and then determines which ports to block based on path cost. If path costs are equal it then compares BIDs. Lower numbers are preferred. In the output above, the link between S1 and S3 has the highest cost to the root bridge. The path cost through both switches is the same, so STA selected the path through the switch with the lower BID, and blocked the port (F0/4) on the switch with the higher BID (S1).

Part 3: Observe STP Port Selection Based on Port Cost

The spanning tree algorithm (STA) uses the root bridge as the reference point and then determines which ports to block, based on path cost. The port with the lower path cost is preferred. If port costs are equal, then spanning tree compares BIDs. If the BIDs are equal, then the port priorities are used to break the tie. Lower values are always preferred. In Part 3, you will change the port cost to control which port is blocked by spanning tree.

Step 1: Locate the switch with the blocked port.

With the current configuration, only one switch should have a port that is blocked by STP. Issue the **show spanning-tree** command on both non-root switches. In the example below, spanning tree is blocking port F0/4 on the switch with the highest BID (S1).

S1# show spanning-tree

Note: Root bridge and port selection may differ in your topology.

Step 2: Change port cost.

In addition to the blocked port, the only other active port on this switch is the port designated as the root port. Lower the cost of this root port to 18 by issuing the **spanning-tree cost 18** interface configuration mode command.

```
S1(config) # interface f0/2
S1(config-if) # spanning-tree cost 18
```

Step 3: Observe spanning tree changes.

S1# show spanning-tree

Re-issue the **show spanning-tree** command on both non-root switches. Observe that the previously blocked port (S1 - F0/4) is now a designated port and spanning tree is now blocking a port on the other non-root switch (S3 - F0/4).

```

Why did spanning tree change the previously blocked port to a designated port, and block the port that was a designated port on the other switch?

STP looks at path cost first. The port with the lower path cost will always be preferred over a port with a higher path cost.

Step 4: Remove port cost changes.

a. Issue the **no spanning-tree cost 18** interface configuration mode command to remove the cost statement that you created earlier.

```
S1(config) # interface f0/2
```

S1(config-if) # no spanning-tree cost 18

b. Re-issue the **show spanning-tree** command to verify that STP has reset the port on the non-root switches back to the original port settings. It takes approximately 30 seconds for STP to complete the port transition process.

Part 4: Observe STP Port Selection Based on Port Priority

If port costs are equal, then spanning tree compares BIDs. If the BIDs are equal, then the port priorities are used to break the tie. The default port priority value is 128. STP aggregates the port priority with the port number to break ties. Lower values are always preferred. In Part 4, you will activate redundant paths to each switch to observe how STP selects a port using the port priority.

a. Activate ports F0/1 and F0/3 on all switches.

S1(config) # interface range f0/1, f0/3

```
S1 (config-if-range) # no shutdown
S1 (config-if-range) # end
S2 (config) # interface range f0/1, f0/3
S2 (config-if-range) # no shutdown
S2 (config) # interface range f0/1, f0/3
S3 (config) # interface range f0/1, f0/3
S3 (config-if-range) # no shutdown
S3 (config-if-range) # end
```

b. Wait 30 seconds for STP to complete the port transition process, and then issue the show spanning-tree command on the non-root switches. Observe that the root port has moved to the lower numbered port linked to the root switch, and blocked the previous root port.

```
S1# show spanning-tree
```

What port did STP select as the root port on each non-root switch?

Answers will vary, but in the example above S1 – F0/1, and S3 – F0/1.

Why did STP select these ports as the root port on these switches?

The default port value of the ports is 128; therefore, STP used the port number to break the tie. It selected the lower port number as the root port, and blocked the higher-numbered port with the redundant path to the root bridge.

Reflection

1. After a root bridge has been selected, what is the first value STP uses to determine port selection?

Path cost. It selects the path with the lower accumulated cost.

2. If the first value is equal on the two ports, what is the next value that STP uses to determine port selection?

BID by selecting the lower value.

3. If both values are equal on the two ports, what is the next value that STP uses to determine port selection?

An aggregation of the port priority and the port number, the lower value is preferred.

2.3.2.3 Lab – Configuring Rapid PVST+, PortFast, and BPDU Guard

Note: Red font color or Gray highlights indicate text that appears in the instructor copy only.

Topology

Addressing Table

Device	Interface	IP Address	Subnet Mask
S1	VLAN 99	192.168.1.11	255.255.255.0
S2	VLAN 99	192.168.1.12	255.255.255.0
S3	VLAN 99	192.168.1.13	255.255.255.0
PC-A	NIC	192.168.0.2	255.255.255.0
PC-C	NIC	192.168.0.3	255.255.255.0

VLAN Assignments

VLAN	Name
10	User
99	Management

Objectives

Part 1: Build the Network and Configure Basic Device Settings

Part 2: Configure VLANs, Native VLAN, and Trunks

- Part 3: Configure the Root Bridge and Examine PVST+ Convergence
- Part 4: Configure Rapid PVST+, PortFast, BPDU Guard, and Examine Convergence

Background / Scenario

The Per-VLAN Spanning Tree (PVST) protocol is Cisco proprietary. Cisco switches default to PVST. Rapid PVST+ (IEEE 802.1w) is an enhanced version of PVST+ and allows for faster spanning-tree calculations and convergence in response to Layer 2 topology changes. Rapid PVST+ defines three port states: discarding, learning, and forwarding, and provides multiple enhancements to optimize network performance.

In this lab, you will configure the primary and secondary root bridge, examine PVST+ convergence, configure Rapid PVST+ and compare its convergence to PVST+. In addition, you will configure edge ports to transition immediately to a forwarding state using PortFast and prevent the edge ports from forwarding BDPUs using BDPU guard.

Note: This lab provides minimal assistance with the actual commands necessary for configuration. However, the required commands are provided in Appendix A. Test your knowledge by trying to configure the devices without referring to the appendix.

Note: The switches used with CCNA hands-on labs are Cisco Catalyst 2960s with Cisco IOS Release 15.0(2) (lanbasek9 image). Other switches and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and output produced might vary from what is shown in the labs.

Note: Make sure that the switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Refer to the Instructor Lab Manual for the procedures to initialize and reload devices.

Required Resources

- 3 Switches (Cisco 2960 with Cisco IOS Release 15.0(2) lanbasek9 image or comparable)
- 2 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet cables as shown in the topology

Part 1: Build the Network and Configure Basic Device Settings

In Part 1, you will set up the network topology and configure basic settings, such as the interface IP addresses, device access, and passwords.

Step 1: Cable the network as shown in the topology.

- Step 2: Configure PC hosts.
- Step 3: Initialize and reload the switches as necessary.

Step 4: Configure basic settings for each switch.

- a. Disable DNS lookup.
- b. Configure the device name as shown in the Topology.
- c. Assign cisco as the console and vty passwords and enable login.
- d. Assign class as the encrypted privileged EXEC mode password.
- e. Configure logging synchronous to prevent console messages from interrupting command entry.

- f. Shut down all switch ports.
- g. Copy the running configuration to startup configuration.

Part 2: Configure VLANs, Native VLAN, and Trunks

In Part 2, you will create VLANs, assign switch ports to VLANs, configure trunk ports, and change the native VLAN for all switches.

Note: The required commands for Part 2 are provided in Appendix A. Test your knowledge by trying to configure the VLANs, native VLAN, and trunks without referring to the appendix.

Step 1: Create VLANs.

Use the appropriate commands to create VLANs 10 and 99 on all of the switches. Name VLAN 10 as **User** and VLAN 99 as **Management**.

```
S1(config)# vlan 10
S1(config-vlan)# name User
S1(config-vlan)# vlan 99
S1(config-vlan)# name Management
S2(config)# vlan 10
S2(config-vlan)# name User
S2(config-vlan)# vlan 99
S2(config-vlan)# name Management
S3(config)# vlan 10
S3(config-vlan)# name User
S3(config-vlan)# name User
S3(config-vlan)# vlan 99
S3(config-vlan)# vlan 99
```

Step 2: Enable user ports in access mode and assign VLANs.

For S1 F0/6 and S3 F0/18, enable the ports, configure them as access ports, and assign them to VLAN 10.

```
S1(config)# interface f0/6
S1(config-if)# no shutdown
S1(config-if)# switchport mode access
S1(config-if)# switchport access vlan 10
S3(config)# interface f0/18
S3(config-if)# no shutdown
S3(config-if)# switchport mode access
S3(config-if)# switchport access vlan 10
```

Step 3: Configure trunk ports and assign to native VLAN 99.

For ports F0/1 and F0/3 on all switches, enable the ports, configure them as trunk ports, and assign them to native VLAN 99.

```
S1(config)# interface range f0/1,f0/3
S1(config-if)# no shutdown
S1(config-if)# switchport mode trunk
S1(config-if)# switchport trunk native vlan 99
S2(config)# interface range f0/1,f0/3
S2(config-if)# no shutdown
S2(config-if)# switchport mode trunk
S2(config-if)# switchport trunk native vlan 99
S3(config)# interface range f0/1,f0/3
S3(config-if)# no shutdown
S3(config-if)# switchport mode trunk
S3(config-if)# switchport trunk native vlan 99
```

Step 4: Configure the management interface on all switches.

Using the Addressing Table, configure the management interface on all switches with the appropriate IP address.

```
S1(config)# interface vlan 99
S1(config-if)# ip address 192.168.1.11 255.255.255.0
S2(config)# interface vlan 99
S2(config-if)# ip address 192.168.1.12 255.255.255.0
S3(config)# interface vlan 99
S3(config-if)# ip address 192.168.1.13 255.255.255.0
```

Step 5: Verify configurations and connectivity.

Use the **show vlan brief** command on all switches to verify that all VLANs are registered in the VLAN table and that the correct ports are assigned.

S1# show vlan brief

VLAN	Name	Status	Ports				
1	default	active	Fa0/2,	Fa0/4,	Fa0/5,	Fa0/7	

			Fa0/8, Fa	10/9, Fa	0/10, Fa	a0/11
			Fa0/12, F	a0/13,	Fa0/14,	Fa0/15
			Fa0/16, F	a0/17 ,	Fa0/18,	Fa0/19
			Fa0/20, F	a0/21 ,	Fa0/22,	Fa0/23
			Fa0/24, G	Gi0/1, G	i0/2	
10	User	active	Fa0/6			
99	Management	active				
1002	fddi-default	act/unsup				
1003	token-ring-default	act/unsup				
1004	fddinet-default	act/unsup				
1005	trnet-default	act/unsup				

S2# show vlan brief

VLAN	Name	Status	Ports
1	default	active	Fa0/2, Fa0/4, Fa0/5, Fa0/6
-			Fa0/7, Fa0/8, Fa0/9, Fa0/10
			Fa0/11, Fa0/12, Fa0/13, Fa0/14
			Fa0/15, Fa0/16, Fa0/17, Fa0/18
			Fa0/19, Fa0/20, Fa0/21, Fa0/22
			Fa0/23, Fa0/24, Gi0/1, Gi0/2
10	User	active	
99	Management	active	
1002	fddi-default	act/unsup	
1003	token-ring-default	act/unsup	
1004	fddinet-default	act/unsup	
1005	trnet-default	act/unsup	

S3# show vlan brief

VLAN	Name	Status	Ports
1	default	active	Fa0/2, Fa0/4, Fa0/5, Fa0/6
			Fa0/7, Fa0/8, Fa0/9, Fa0/10
			Fa0/11, Fa0/12, Fa0/13, Fa0/14
			Fa0/15, Fa0/16, Fa0/17, Fa0/19
			Fa0/20, Fa0/21, Fa0/22, Fa0/23
			Fa0/24, Gi0/1, Gi0/2
10	User	active	Fa0/18
99	Management	active	

1002	fddi-default	act/unsup
1003	token-ring-default	act/unsup
1004	fddinet-default	act/unsup
1005	trnet-default	act/unsup

Use the **show interfaces trunk** command on all switches to verify trunk interfaces.

S1# show interfaces trunk

Port	Mode	Encapsulation	Status	Native vlan
Fa0/1	on	802.1q	trunking	99
Fa0/3	on	802.1q	trunking	99
Port	Vlans allowed on	trunk		
Fa0/1	1-4094			
Fa0/3	1-4094			
Port	Vlans allowed and	d active in man	agement domain	
Fa0/1	1,10,99			
Fa0/3	1,10,99			
Port	Vlans in spannin	g tree forwardi	ng state and n	ot pruned
Fa0/1	none			
Fa0/3	1,10,99			

S2# show interfaces trunk

Port	Mode	Encapsulation	Status	Native vlan
Fa0/1	on	802.1q	trunking	99
Fa0/3	on	802.1q	trunking	99
Port	Vlans allowed on	trunk		
Fa0/1	1-4094			
Fa0/3	1-4094			
Port	Vlans allowed and	d active in mana	agement domain	
Fa0/1	1,10,99			
Fa0/3	1,10,99			
Port	Vlans in spanning	g tree forwardin	ng state and no	ot pruned
Fa0/1	1,10,99			
Fa0/3	1,10,99			

Port	Mode	Encapsulation	Status	Native vlan
Fa0/1	on	802.1q	trunking	99
Fa0/3	on	802.1q	trunking	99
Port	Vlans allowed on	trunk		
Fa0/1	1-4094			
Fa0/3	1-4094			
Port	Vlans allowed and	d active in man	agement domain	
Fa0/1	1,10,99			
Fa0/3	1,10,99			
Port	Vlans in spannin	g tree forwardi	ng state and n	ot pruned
Fa0/1	1,10,99			
Fa0/3	1,10,99			

S3# show interfaces trunk

Use the **show running-config** command on all switches to verify all other configurations.

```
S1# show running-config

What is the default setting for spanning-tree mode on Cisco switches?

The default spanning-tree mode is PVST+.

Verify connectivity between PC-A and PC-C. Was your ping successful? _____ Yes.

If your ping was unsuccessful, troubleshoot the configurations until the issue is resolved.

Note: It may be necessary to disable the PC firewall to successfully ping between PCs.

Part 3: Configure the Root Bridge and Examine PVST+ Convergence

In Part 3, you will determine the default root in the network, assign the primary and secondary root, and use the **debug** command to examine convergence of PVST+.

Note: The required commands for Part 3 are provided in Appendix A. Test your knowledge by trying to configure the root bridge without referring to the appendix.

Step 1: Determine the current root bridge.

Which command allows a user to determine the spanning-tree status of a Cisco Catalyst switch for all VLANs? Write the command in the space provided.

show spanning-tree

Use the command on all three switches to determine the answers to the following questions:

Note: There are three instances of the spanning tree on each switch. The default STP configuration on Cisco switches is PVST+, which creates a separate spanning tree instance for each VLAN (VLAN 1 and any user-configured VLANs).

What is the bridge priority of switch S1 for VL	AN 1?	32769
What is the bridge priority of switch S2 for VL	AN 1?	32769
What is the bridge priority of switch S3 for VL	AN 1?	32769
Which switch is the root bridge?	Answers will vary. I	n this configuration, it is switch S3.
	- 0	

Why was this switch elected as the root bridge?

By default, spanning tree elects the root bridge based on lowest MAC address.

```
S1# show spanning-tree
```

Step 2: Configure a primary and secondary root bridge for all existing VLANs.

Having a root bridge (switch) elected by MAC address may lead to a suboptimal configuration. In this lab, you will configure switch S2 as the root bridge and S1 as the secondary root bridge.

a. Configure switch S2 to be the primary root bridge for all existing VLANs. Write the command in the space provided.

S2(config)# spanning-tree vlan 1,10,99 root primary

 Configure switch S1 to be the secondary root bridge for all existing VLANs. Write the command in the space provided.

S1(config) # spanning-tree vlan 1,10,99 root secondary Use the **show spanning-tree** command to answer the following questions: What is the bridge priority of S1 for VLAN 1? _____ 28673 What is the bridge priority of S2 for VLAN 1? _____ 24577 Which interface in the network is in a blocking state? Step 3: Change the Layer 2 topology and examine convergence.

To examine PVST+ convergence, you will create a Layer 2 topology change while using the **debug** command to monitor spanning-tree events.

a. Enter the debug spanning-tree events command in privileged EXEC mode on switch S3.

S3# debug spanning-tree events

Spanning Tree event debugging is on

b. Create a topology change by disabling interface F0/1 on S3.

```
S3(config) # interface f0/1
S3(config-if) # shutdown
*Mar 1 00:58:56.225: STP: VLAN0001 new root port Fa0/3, cost 38
*Mar 1 00:58:56.225: STP: VLAN0001 Fa0/3 -> listening
*Mar 1 00:58:56.225: STP[1]: Generating TC trap for port FastEthernet0/1
*Mar 1 00:58:56.225: STP: VLAN0010 new root port Fa0/3, cost 38
*Mar 1 00:58:56.225: STP: VLAN0010 Fa0/3 -> listening
*Mar 1 00:58:56.225: STP[10]: Generating TC trap for port FastEthernet0/1
```

*Mar 1 00:58:56.225: STP: VLAN0099 new root port Fa0/3, cost 38 *Mar 1 00:58:56.225: STP: VLAN0099 Fa0/3 -> listening *Mar 1 00:58:56.225: STP[99]: Generating TC trap for port FastEthernet0/1 *Mar 1 00:58:56.242: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down *Mar 1 00:58:56.242: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan99, changed state to down *Mar 1 00:58:58.214: %LINK-5-CHANGED: Interface FastEthernet0/1, changed state to administratively down *Mar 1 00:58:58.230: STP: VLAN0001 sent Topology Change Notice on Fa0/3 *Mar 1 00:58:58.230: STP: VLAN0010 sent Topology Change Notice on Fa0/3 *Mar 1 00:58:58.230: STP: VLAN0099 sent Topology Change Notice on Fa0/3 *Mar 1 00:58:59.220: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to down *Mar 1 00:59:11.233: STP: VLAN0001 Fa0/3 -> learning *Mar 1 00:59:11.233: STP: VLAN0010 Fa0/3 -> learning *Mar 1 00:59:11.233: STP: VLAN0099 Fa0/3 -> learning *Mar 1 00:59:26.240: STP[1]: Generating TC trap for port FastEthernet0/3 *Mar 1 00:59:26.240: STP: VLAN0001 Fa0/3 -> forwarding 1 00:59:26.240: STP[10]: Generating TC trap for port FastEthernet0/3 *Mar *Mar 1 00:59:26.240: STP: VLAN0010 sent Topology Change Notice on Fa0/3 *Mar 1 00:59:26.240: STP: VLAN0010 Fa0/3 -> forwarding *Mar 1 00:59:26.240: STP[99]: Generating TC trap for port FastEthernet0/3 *Mar 1 00:59:26.240: STP: VLAN0099 Fa0/3 -> forwarding *Mar 1 00:59:26.248: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to up *Mar 1 00:59:26.248: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan99, changed state to up

Note: Before proceeding, use the **debug** output to verify that all VLANs on F0/3 have reached a forwarding state then use the command **no debug spanning-tree events** to stop the **debug** output.

Through which port states do each VLAN on F0/3 proceed during network convergence?

Listening, learning, and forwarding

Using the time stamp from the first and last STP debug message, calculate the time (to the nearest second) that it took for the network to converge. **Hint**: The debug timestamp format is date hh.mm.ss:msec.

Answers may vary slightly but convergence time should be approximately 30 seconds.

Part 4: Configure Rapid PVST+, PortFast, BPDU Guard, and Examine Convergence

In Part 4, you will configure Rapid PVST+ on all switches. You will configure PortFast and BPDU guard on all access ports, and then use the **debug** command to examine Rapid PVST+ convergence.

Note: The required commands for Part 4 are provided in Appendix A. Test your knowledge by trying to configure the Rapid PVST+, PortFast, and BPDU guard without referring to the appendix.

Step 1: Configure Rapid PVST+.

a. Configure S1 for Rapid PVST+. Write the command in the space provided.

```
S1(config)# spanning-tree mode rapid-pvst
```

b. Configure S2 and S3 for Rapid PVST+.

```
S2(config) # spanning-tree mode rapid-pvst
```

```
S3(config) # spanning-tree mode rapid-pvst
```

c. Verify configurations with the show running-config | include spanning-tree mode command.

```
S1# show running-config | include spanning-tree mode
spanning-tree mode rapid-pvst
S2# show running-config | include spanning-tree mode
spanning-tree mode rapid-pvst
```

S3# show running-config | include spanning-tree mode

spanning-tree mode rapid-pvst

Step 2: Configure PortFast and BPDU Guard on access ports.

PortFast is a feature of spanning tree that transitions a port immediately to a forwarding state as soon as it is turned on. This is useful in connecting hosts so that they can start communicating on the VLAN instantly, rather than waiting on spanning tree. To prevent ports that are configured with PortFast from forwarding BP-DUs, which could change the spanning tree topology, BPDU guard can be enabled. At the receipt of a BPDU, BPDU guard disables a port configured with PortFast.

a. Configure interface F0/6 on S1 with PortFast. Write the command in the space provided.

```
S1(config) # interface f0/6
```

S1(config-if) # spanning-tree portfast

b. Configure interface F0/6 on S1 with BPDU guard. Write the command in the space provided.

```
S1(config) # interface f0/6
S1(config-if) # spanning-tree bpduguard enable
```

c. Globally configure all non-trunking ports on switch S3 with PortFast. Write the command in the space provided.

d. Globally configure all non-trunking PortFast ports on switch S3 with BPDU guard. Write the command in the space provided.

S3(config) # spanning-tree portfast bpduguard default

Step 3: Examine Rapid PVST+ convergence.

- Enter the debug spanning-tree events command in privileged EXEC mode on switch S3.
- b. Create a topology change by enabling interface F0/1 on switch S3.

```
S3(config) # interface f0/1
```

S3(config-if) # no shutdown

*Mar 1 01:28:34.946: %LINK-3-UPDOWN: Interface FastEthernet0/1, changed state to up *Mar 1 01:28:37.588: RSTP(1): initializing port Fa0/1

*Mar 1 01:28:38.595: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to up

Using the time stamp from the first and last RSTP debug message, calculate the time that it took for the network to converge.

Answers may vary slightly but convergence time should be under a second.

Reflection

1. What is the main benefit of using Rapid PVST+?

Rapid PVST+ decreases the time of Layer 2 convergence significantly over PVST+.

2. How does configuring a port with PortFast allow for faster convergence?

PortFast allows for an access port to immediately transition into a forwarding state which decreases Layer 2 convergence time.

3. What protection does BPDU guard provide?

BPDU guard protects the STP domain by disabling access ports that receive a BPDU. BPDUs can be used in a denial of service attack that changes a domain's root bridge and forces an STP recalculation.

Appendix A – Switch Configuration Commands

Switch S1

```
S1(config) # vlan 10

2.4.3.4 Lab – Configuring HSRP and GLBP (Instructor Version)

Red font color or Gray highlights indicate text that appears in the instructor copy only.

Topology

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
R1	G0/1	192.168.1.1	255.255.255.0	N/A
	S0/0/0 (DCE)	10.1.1.1	255.255.255.252	N/A
R2	S0/0/0	10.1.1.2	255.255.255.252	N/A
	S0/0/1 (DCE)	10.2.2.2	255.255.255.252	N/A
	Lo1	209.165.200.225	255.255.255.224	N/A
R3	G0/1	192.168.1.3	255.255.255.0	N/A
	S0/0/1	10.2.2.1	255.255.255.252	N/A
S1	VLAN 1	192.168.1.11	255.255.255.0	192.168.1.1
S3	VLAN 1	192.168.1.13	255.255.255.0	192.168.1.3
PC-A	NIC	192.168.1.31	255.255.255.0	192.168.1.1
PC-C	NIC	192.168.1.33	255.255.255.0	192.168.1.3

Objectives

Part 1: Build the Network and Verify Connectivity

Part 2: Configure First Hop Redundancy using HSRP

Part 3: Configure First Hop Redundancy using GLBP

Background / Scenario

Spanning tree provides loop-free redundancy between switches within your LAN. However, it does not provide redundant default gateways for end-user devices within your network if one of your routers fails. First Hop Redundancy Protocols (FHRPs) provide redundant default gateways for end devices with no end-user configuration necessary.

In this lab, you will configure two FHRPs. In Part 2, you will configure Cisco's Hot Standby Routing Protocol (HSRP), and in Part 3 you will configure Cisco's Gateway Load Balancing Protocol (GLBP).

Note: The routers used with CCNA hands-on labs are Cisco 1941 Integrated Services Routers (ISRs) with Cisco IOS Release 15.2(4)M3 (universalk9 image). The switches used are Cisco Catalyst 2960s with Cisco IOS Release 15.0(2) (lanbasek9 image). Other routers, switches, and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and output produced might vary from what is shown in the labs. Refer to the Router Interface Summary Table at the end of this lab for the correct interface identifiers.

Note: Make sure that the routers and switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Refer to the Instructor Lab Manual for the procedures to initialize and reload devices.

Required Resources

- 3 Routers (Cisco 1941 with Cisco IOS Release 15.2(4)M3 universal image or comparable)
- 2 Switches (Cisco 2960 with Cisco IOS Release 15.0(2) lanbasek9 image or comparable)
- 2 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet and serial cables as shown in the topology

Part 1: Build the Network and Verify Connectivity

In Part 1, you will set up the network topology and configure basic settings, such as the interface IP addresses, static routing, device access, and passwords.

Step 1: Cable the network as shown in the topology.

Attach the devices as shown in the topology diagram, and cable as necessary.

Step 2: Configure PC hosts.

Step 3: Initialize and reload the routers and switches as necessary.

Step 4: Configure basic settings for each router.

- a. Disable DNS lookup.
- b. Configure the device name as shown in the topology.
- c. Configure IP addresses for the routers as listed in the Addressing Table.
- d. Set clock rate to **128000** for all DCE serial interfaces.
- e. Assign **class** as the encrypted privileged EXEC mode password.
- f. Assign **cisco** for the console and vty password and enable login.
- g. Configure logging synchronous to prevent console messages from interrupting command entry.
- h. Copy the running configuration to the startup configuration.

Step 5: Configure basic settings for each switch.

- a. Disable DNS lookup.
- b. Configure the device name as shown in the topology.
- c. Assign class as the encrypted privileged EXEC mode password.
- d. Configure IP addresses for the switches as listed in the Addressing Table.
- e. Configure the default gateway on each switch.
- f. Assign **cisco** for the console and vty password and enable login.
- g. Configure logging synchronous to prevent console messages from interrupting command entry.
- h. Copy the running configuration to the startup configuration.

Step 6: Verify connectivity between PC-A and PC-C.

Ping from PC-A to PC-C. Were the ping results successful? _____ Yes

If the pings are not successful, troubleshoot the basic device configurations before continuing.

Note: It may be necessary to disable the PC firewall to successfully ping between PCs.

Step 7: Configure routing.

- a. Configure EIGRP on the routers and use AS of 1. Add all the networks, except 209.165.200.224/27 into the EIGRP process.
- b. Configure a default route on R2 using Lo1 as the exit interface to 209.165.200.224/27 network and redistribute this route into the EIGRP process.

Step 8: Verify connectivity.

- a. From PC-A, you should be able to ping every interface on R1, R2, R3, and PC-C. Were all pings successful? _____Yes
- b. From PC-C, you should be able to ping every interface on R1, R2, R3, and PC-A. Were all pings successful? _____Yes

Part 2: Configure First Hop Redundancy Using HSRP

Even though the topology has been designed with some redundancy (two routers and two switches on the same LAN network), both PC-A and PC-C are configured with only one gateway address. PC-A is using R1 and PC-C is using R3. If either of these routers or the interfaces on the routers went down, the PC could lose its connection to the Internet.

In Part 2, you will test how the network behaves both before and after configuring HSRP. To do this, you will determine the path that packets take to the loopback address on R2.

Step 1: Determine the path for Internet traffic for PC-A and PC-C.

 From a command prompt on PC-A, issue a tracert command to the 209.165.200.225 loopback address of R2.

C:\ tracert 209.165.200.225

Tracing route to 209.165.200.225 over a maximum of 30 hops

1 1 ms 1 ms 1 ms 192.168.1.1 2 13 ms 13 ms 13 ms 209.165.200.225

Trace complete.

What path did the packets take from PC-A to 209.165.200.225? _____ PC-A to R1 to R2

 From a command prompt on PC-C, issue a tracert command to the 209.165.200.225 loopback address of R2.

What path did the packets take from PC-C to 209.165.200.225? _____ PC-C to R3 to R2

Step 2: Start a ping session on PC-A, and break the connection between S1 and R1.

a. From a command prompt on PC-A, issue a **ping –t** command to the **209.165.200.225** address on R2. Make sure you leave the command prompt window open.

Note: The pings continue until you press Ctrl+C, or until you close the command prompt window.

C:\ ping -t 209.165.200.225 Pinging 209.165.200.225 with 32 bytes of data: Reply from 209.165.200.225: bytes=32 time=9ms TTL=254 Reply from 209.165.200.225: bytes=32 time=9ms TTL=254 Reply from 209.165.200.225: bytes=32 time=9ms TTL=254

```
Reply from 209.165.200.225: bytes=32 time=9ms TTL=254
```

As the ping continues, disconnect the Ethernet cable from F0/5 on S1. You can also shut down the S1 F0/5 interface, which creates the same result.

What happened to the ping traffic?

```
After the cable was disconnected from F0/5 on S1 (or the interface was shut down), pings failed. Sample output is below.

Request timed out.

Request timed out.

Request timed out.

Request timed out.

<output omitted>

Perpent Stops 2a and 2b on PC C and S2 Disconnect cable from E0/5 on S2
```

c. Repeat Steps 2a and 2b on PC-C and S3. Disconnect cable from F0/5 on S3.

What were your results?

```
The results were the same as on PC-A. After the Ethernet cable was disconnected from F0/5 on S3, the pings failed.
```

d. Reconnect the Ethernet cables to F0/5 or enable the F0/5 interface on both S1 and S3, respectively. Reissue pings to 209.165.200.225 from both PC-A and PC-C to make sure connectivity is re-established.

Step 3: Configure HSRP on R1 and R3.

In this step, you will configure HSRP and change the default gateway address on PC-A, PC-C, S1, and S2 to the virtual IP address for HSRP. R1 becomes the active router via configuration of the HSRP priority command.

a. Configure HSRP on R1.

R1 (config) # interface g0/1
R1 (config-if) # standby 1 ip 192.168.1.254
R1 (config-if) # standby 1 priority 150
R1 (config-if) # standby 1 preempt

b. Configure HSRP on R3.

```
R3(config) # interface g0/1
```

R3(config-if) # standby 1 ip 192.168.1.254

c. Verify HSRP by issuing the **show standby** command on R1 and R3.

```
R1# show standby
GigabitEthernet0/1 - Group 1
 State is Active
   1 state change, last state change 00:02:11
 Virtual IP address is 192.168.1.254
 Active virtual MAC address is 0000.0c07.ac01
   Local virtual MAC address is 0000.0c07.ac01 (v1 default)
 Hello time 3 sec, hold time 10 sec
   Next hello sent in 0.784 secs
 Preemption enabled
 Active router is local
 Standby router is 192.168.1.3, priority 100 (expires in 9.568 sec)
 Priority 150 (configured 150)
 Group name is "hsrp-Gi0/1-1" (default)
R3# show standby
GigabitEthernet0/1 - Group 1
 State is Standby
   4 state changes, last state change 00:02:20
 Virtual IP address is 192.168.1.254
 Active virtual MAC address is 0000.0c07.ac01
   Local virtual MAC address is 0000.0c07.ac01 (v1 default)
 Hello time 3 sec, hold time 10 sec
   Next hello sent in 2.128 secs
 Preemption disabled
 Active router is 192.168.1.1, priority 150 (expires in 10.592 sec)
```

Standby router is local

Priority 100 (default 100)

Group name is "hsrp-Gi0/1-1" (default)

Using the output shown above, answer the following questions:

Which router is the active router? _____ R1

What is the MAC address for the virtual IP address? ______ 0000.0c07.ac01

What is the IP address and priority of the standby router?

IP address is 192.168.1.3 and the priority is 100 (the default which is less than that of R1, the active router, with a priority of 150).

d. Use the **show standby brief** command on R1 and R3 to view an HSRP status summary. Sample output is shown below.

```
R1# show standby brief
                 P indicates configured to preempt.
                 1
Interface Grp Pri P State Active
                                     Standby
                                                  Virtual IP
Gi0/1
        1 150 P Active local
                                     192.168.1.3
                                                   192.168.1.254
R3# show standby brief
                 P indicates configured to preempt.
                 Interface Grp Pri P State Active Standby
                                                  Virtual IP
Gi0/1
        1 100 Standby 192.168.1.1 local
                                                   192.168.1.254
```

e. Change the default gateway address for PC-A, PC-C, S1, and S3. Which address should you use?

192.168.1.254

Verify the new settings. Issue a ping from both PC-A and PC-C to the loopback address of R2. Are the pings successful? _____ Yes

Step 4: Start a ping session on PC-A and break the connection between the switch that is connected to the Active HSRP router (R1).

- a. From a command prompt on PC-A, issue a **ping –t** command to the 209.165.200.225 address on R2. Ensure that you leave the command prompt window open.
- b. As the ping continues, disconnect the Ethernet cable from F0/5 on S1 or shut down the F0/5 interface.

What happened to the ping traffic?

A few packets may be dropped while the Standby router takes over. Sample output is shown below: Reply from 209.165.200.225: bytes=32 time=9ms TTL=254 Request timed out. Reply from 209.165.200.225: bytes=32 time=9ms TTL=254 <output Omitted>

Step 5: Verify HSRP settings on R1 and R3.

a. Issue the **show standby brief** command on R1 and R3.

Which router is the active router?

- b. Reconnect the cable between the switch and the router or enable interface F0/5.
- c. Disable the HSRP configuration commands on R1 and R3.

```
R1(config)# interface g0/1
R1(config-if)# no standby 1
R3(config)# interface g0/1
```

R3(config-if) # no standby 1

Part 3: Configure First Hop Redundancy Using GLBP

By default, HSRP does NOT do load balancing. The active router always handles all of the traffic, while the standby router sits unused, unless there is a link failure. This is not an efficient use of resources. GLBP provides nonstop path redundancy for IP by sharing protocol and MAC addresses between redundant gateways. GLBP also allows a group of routers to share the load of the default gateway on a LAN. Configuring GLBP is very similar to HSRP. Load balancing can be done in a variety of ways using GLBP. In this lab, you will use the round-robin method.

Step 1: Configure GLBP on R1 and R3.

a. Configure GLBP on R1.

```
R1 (config) # interface g0/1
R1 (config-if) # glbp 1 ip 192.168.1.254
R1 (config-if) # glbp 1 preempt
R1 (config-if) # glbp 1 priority 150
R1 (config-if) # glbp 1 load-balancing round-robin
```

- b. Configure GLBP on R3.
 - R3(config) # interface g0/1
 - R3(config-if) # glbp 1 ip 192.168.1.254
 - R3(config-if) # glbp 1 load-balancing round-robin

Step 2: Verify GLBP on R1 and R3.

a. Issue the **show glbp brief** command on R1 and R3.

```
R1# show glbp brief
```

Interface	Grp	Fwd	Pri	State	Address	Active router	Standby router
Gi0/1	1	-	150	Active	192.168.1.254	local	192.168.1.3
Gi0/1	1	1	-	Active	0007.b400.0101	local	-
Gi0/1	1	2	-	Listen	0007.b400.0102	192.168.1.3	-

R3# show glbp brief

Interface	Grp	Fwd	Pri	State	Address	Active router	Standby router
Gi0/1	1	-	100	Standby	192.168.1.254	192.168.1.1	local
Gi0/1	1	1	-	Listen	0007.b400.0101	192.168.1.1	-
Gi0/1	1	2	-	Active	0007.b400.0102	local	-

Step 3: Generate traffic from PC-A and PC-C to the R2 loopback interface.

a. From a command prompt on PC-A, ping the 209.165.200.225 address of R2.

C:\> ping 209.165.200.225

b. Issue an arp –a command on PC-A. Which MAC address is used for the 192.168.1.254 address?

Answers will vary due to timing, but the MAC address will be either R1 or R3 GLBP G0/1 interface MAC.

c. Generate more traffic to the loopback interface of R2. Issue another **arp** –**a** command. Did the MAC address change for the default gateway address of 192.168.1.254?

Yes. The MAC address changed from R1 to R3 and back. Note: You may need to have students generate traffic multiple times to see the change.

As you can see, both R1 and R3 play a role in forwarding traffic to the loopback interface of R2. Neither router remains idle.

- Step 4: Start a ping session on PC-A, and break the connection between the switch that is connected to R1.
 - a. From a command prompt on PC-A, issue a **ping –t** command to the 209.165.200.225 address on R2. Make sure you leave the command prompt window open.
 - b. As the ping continues, disconnect the Ethernet cable from F0/5 on S1 or shut down the F0/5 interface.

What happened to the ping traffic?

A few packets are dropped while transitioning to the Standby router. Sample output is shown below.

Reply from 209.165.200.225: bytes=32 time=9ms TTL=254 Request timed out. Reply from 209.165.200.225: bytes=32 time=18ms TTL=252 Reply from 209.165.200.225: bytes=32 time=18ms TTL=252

Reflection

1. Why would there be a need for redundancy in a LAN?

In today's networks, down time can be a critical issue affecting sales, productivity, and general connectivity (IP Telephony phones for example).

2. If you had a choice, which protocol would you implement in your network, HSRP or GLBP? Explain your choice.

Answers will vary. HSRP is easier to configure. There are more options with GLBP which can make it complex to configure.

Router Interface Summary								
Router Model	Ethernet Interface #1	Ethernet Interface #2	Serial Interface #1	Serial Interface #2				
1800	Fast Ethernet 0/0 (F0/0)	Fast Ethernet 0/1 (F0/1)	Serial 0/0/0 (S0/0/0)	Serial 0/0/1 (S0/0/1)				
1900	Gigabit Ethernet 0/0 (G0/0)	Gigabit Ethernet 0/1 (G0/1)	Serial 0/0/0 (S0/0/0)	Serial 0/0/1 (S0/0/1)				
2801	Fast Ethernet 0/0 (F0/0)	Fast Ethernet 0/1 (F0/1)	Serial 0/1/0 (S0/1/0)	Serial 0/1/1 (S0/1/1)				
2811	Fast Ethernet 0/0 (F0/0)	Fast Ethernet 0/1 (F0/1)	Serial 0/0/0 (S0/0/0)	Serial 0/0/1 (S0/0/1)				
2900	Gigabit Ethernet 0/0 (G0/0)	Gigabit Ethernet 0/1 (G0/1)	Serial 0/0/0 (S0/0/0)	Serial 0/0/1 (S0/0/1)				

Router Interface Summary Table

Note: To find out how the router is configured, look at the interfaces to identify the type of router and how many interfaces the router has. There is no way to effectively list all the combinations of configurations for each router class. This table includes identifiers for the possible combinations of Ethernet and Serial interfaces in the device. The table does not include any other type of interface, even though a specific router may contain one. An example of this might be an ISDN BRI interface. The string in parenthesis is the legal abbreviation that can be used in Cisco IOS commands to represent the interface.

2.5.1.1 Class Activity– Documentation Tree (Instructor Version)

Red font color or Gray highlights indicate text that appears in the instructor copy only.

Objective

Identify common STP configuration issues.

This activity may be completed individually or in small groups.

Scenario

The employees in your building are having difficulty accessing a web server on the network. You look for the network documentation that the previous network engineer used before he transitioned to a new job; however, you cannot find any network documentation whatsoever.

Therefore, you decide create your own network recordkeeping system. You decide to start at the access layer of your network hierarchy. This is where redundant switches are located, as well as the company servers, printers, and local hosts.

You create a matrix to record your documentation and include access layer switches on the list. You also decide to document switch names, ports in use, cabling connections, and root ports, designated ports, and alternate ports.

For more detailed instructions on how to design your model, use the student PDF that accompanies this activity.

Resources

- Packet Tracer software
- Word processing software

Directions

- Step 1: Create the topology diagram with three redundant switches.
- Step 2: Connect host devices to the switches.

Step 3: Create the switch documentation matrix.

- a. Name and switch location
- b. General switch description
- c. Model, IOS version, and image name
- d. Switch serial number
- e. MAC address
- f. Ports currently in use
- g. Cable connections
- h. Root ports
- i. Designated ports, status, and cost
- j. Alternate ports, status, and cost

Step 4: Use show commands to locate Layer 2 switch information.

- a. show version
- b. show cdp neighbors detail
- c. show spanning-tree

Documentation Form Example (S1 only)

Switch Name and Location	S1 – Main Distribution Facility
General Switch Description	Access Layer Switch – grants network access for PCs 01-03
Switch Model, IOS Version, and Image Name	WS-C2960-24TT
	12.2
	C2960-LANBASE-M
Switch Serial Number	FOC1033Z1EY
Switch MAC Address	0050.0F5C.A2D1
Ports in Use	Fa0/2
	Fa0/3
	Fa0/1
	Gi1/1
	Gi1/2
Cable Connections	Fa0/2 connected to PC-02
	Fa0/3 connected to PC-03
	Fa0/1 connected to PC-01
	Gi1/1 connected to S2 Gi1/1
	Gi1/2 connected to S3 Gi1/2
Root Port	Gi1/2
Designated Port(s), Status, and Cost	Fa0/1, Forwarding, Cost 19
	Fa0/3, Forwarding, Cost 19
	Fa0/2, Forwarding, Cost 19
Alternate Port(s), Status, and Cost	(non-designated port) Gi1/1, Blocking, Cost 4

9.3.1.3 – OSPF Capstone Project (Instructor Version)

Red font color or Gray highlights indicate text that appears in the instructor copy only.

Objectives

- Configure basic OSPFv2 to enable internetwork communications in a small- to medium-sized IPv4 business network.
- Implement advanced OSPF features to enhance operation in a small- to medium-sized business network.
- Implement multiarea OSPF for IPv4 to enable internetwork communications in a small- to medium-sized business network.
- Configure basic OSPFv3 to enable internetwork communications in a small- to medium-sized IPv6 business network.

Instructor Notes:

- Students should be able to design, configure, and secure OSPF in a network.
- Documentation is a large factor of this project and students must be able to explain their network design and verification through the use of **show** commands.
- This activity is:
 - Best completed in groups of 2-3 students
 - Suggested to be a graded assignment after completing all of the OSPF Chapters

Scenario

Your company has made the decision to implement the OSPF routing protocol on its network. You have decided that you need to review the concepts related to OSPF in order to make a smooth transition to this protocol.

Create a network using Packet Tracer. Configure the network with these OSPF routing protocol options:

- Multiarea OSPFv2
- Single-area OSPFv3
- Bandwidth
- Cost
- Authentication
- Default routes
- DR and BDR elections for segments

Required Resources

- Packet Tracer
- Student/group-created rubric for assessment of the assignment

Step 1: Design and build a network from scratch.

- a. Your design must include three routers connected to a multi-access network in area 0 for use with IPv4.
 - 1) Enable authentication.
 - 2) Establish the DR and BDR using the router id command.

Step 2: Add one additional router with two connections to area 0, representing another OSPF area.

- Step 3: Configure the bandwidth or cost to favor one route.
- Step 4: Add a network containing end devices and a passive OSPF interface.
- Step 5: Add a route to a default network such as the Internet.

Step 6: Add an IPv6 addressing scheme on the routers and configure OSPFv3.

- a. Enable IPv6 unicast routing.
- b. Establish the DR and BDR using the router id command.
- c. Do not configure timers, bandwidth, cost, default routes, or authentication.

Instructor-Sample Rubric

The example rubric includes a total of 100 points for the points earned category, if minimum standards are met. Instructors may wish to consider adding bonus points for additional/advanced work in any requirement category.

	Requirement	Points Earned
Physic	cal Topology	
•	A minimum three routers are present in area 0.	
•	One router exists in another area.	(10 suggested)
•	One Internet connection with one PC exists in the topology.	
Logica	al Addressing and Connectivity	
•	IPv4 and IPv6 networks should have full connectiv- ity. Connectivity is verified with pings to every IP, including the Internet.	(20 suggested)
OSPF	Requirement 1	
•	Two OSPFv2 areas exist.	(20 suggested)
•	Two OSPFv3 areas exist.	
OSPF	Requirement 2	
•	OSPF authentication and passive interfaces are used to secure the protocol.	(20 suggested)
OSPF	Requirement 3	
•	Router IDs are used for the election of the DR and BDR.	(10 suggested)
OSPF Requirement 4		
•	The OSPF cost is changed to manipulate preferred routes.	(10 suggested)
OSPF Requirement 5		
•	Static routes and default information originate are used to reach the Internet.	(10 suggested)

Instructor Topology Example Solution

Show IP Route

```
Rl>en
Rl# show ip route
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default, U - per-user static route, o - ODR
P - periodic downloaded static route
Gateway of last resort is 10.0.0.2 to network 0.0.0.0
10.0.0/8 is variably subnetted, 2 subnets, 2 masks
C 10.0.0.0/24 is directly connected, GigabitEthernet0/2
L 10.0.1/32 is directly connected, GigabitEthernet0/2
```

Scaling Networks Lab Manual 1st Edition Cisco Solutions Manual

Full Download: http://alibabadownload.com/product/scaling-networks-lab-manual-1st-edition-cisco-solutions-manual/ 566 Chapter 9 — IOS Images and Licensing

172.16.0.0/16 is variably subnetted, 4 subnets, 2 masks
0 172.16.0.0/24 [110/2] via 10.0.0.3, 00:02:18, GigabitEthernet0/2
C 172.16.1.0/24 is directly connected, GigabitEthernet0/0
L 172.16.1.1/32 is directly connected, GigabitEthernet0/0
0 IA 172.16.2.0/24 [110/2] via 10.0.0.2, 00:02:18, GigabitEthernet0/2
0*E2 0.0.0.0/0 [110/1] via 10.0.0.2, 00:02:18, GigabitEthernet0/2

Show IP Protocols

R1# show ip protocols

Routing Protocol is "ospf 1"	
Outgoing update filter list for all interfaces is not	: set
Incoming update filter list for all interfaces is not	: set
Router ID 10.1.1.1	
Number of areas in this router is 2. 2 normal 0 stub	o 0 nssa
Maximum path: 4	
Routing for Networks:	
10.0.0.0 0.0.255 area 0	
172.16.1.0 0.0.0.255 area 2	
Routing Information Sources:	
Gateway Distance Last Update	
10.1.1.1 110 00:08:18	

10.1.1.1	110	00:08:18
10.2.2.2	110	00:07:29
10.3.3.3	110	00:07:38
Distance: (default	is 110)	

Show IP OSPF Neighbor

R1# show ip ospf neighbor

Neighbor ID	Pri	State	Dead Time	Address	Interface
10.3.3.3	1	FULL/DR	00:00:33	10.0.3	GigabitEthernet0/2
10.2.2.2	1	FULL/BDR	00:00:33	10.0.0.2	GigabitEthernet0/2

Show IP Interface Brief

R1# show ip int brief						
Interface	IP-Address	OK?	Method	Status	Protocol	
GigabitEthernet0/0	172.16.1.1	YES	manual	up	up	
GigabitEthernet0/1	unassigned	YES	unset	administratively down	n down	
GigabitEthernet0/2	10.0.0.1	YES	manual	up	up	
Serial0/0/0	unassigned	YES	unset	administratively down	n down	
Serial0/0/1	unassigned	YES	unset	administratively down	ı down	
Vlan1	unassigned	YES	unset	administratively down	n down
