

1. Psychology is defined as the ____.
- a. scientific study of why people do what they do
 - b. scientific study of behavior and mental processes
 - c. study of the unconscious determinants of personality
 - d. study of mental illness and its treatment

ANSWER: b

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Understand

2. Psychology is best described as a(n) ____.
- a. theory
 - b. science
 - c. pseudoscience
 - d. hypothesis

ANSWER: b

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Thinking Critically

3. Which area of study is one of the American Psychological Association's foundational areas of contemporary psychology?
- a. research design and statistical analysis
 - b. psychodynamic theory
 - c. history of psychology
 - d. developmental and social psychology

ANSWER: d

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Understand

4. Psychologists attempt to understand behavior and mental processes by ____.
- a. using the scientific method
 - b. thinking deeply about the reasons for our behavior
 - c. using common sense to understand why we do what we do
 - d. studying the behavior of people with mental illnesses

ANSWER: a

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Understand

5. Which statement is the most accurate?
- a. We are either left-brain or right-brain thinkers.
 - b. No new neurons develop after infancy.
 - c. Both legal and illegal drugs can cause brain damage.
 - d. During sleep, the brain rests.

ANSWER: c

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Thinking Critically

6. Which statement is the most accurate?

- a. Genes are only active during prenatal development.
- b. Stress can be caused by both good and bad life events.
- c. Our memory works like a video recorder.
- d. People with schizophrenia have multiple personalities.

ANSWER: b

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Thinking Critically

7. A scientific theory is a(n) ____.

- a. opinion that has very limited supporting facts
- b. prediction of some future event
- c. explanation of why and how a behavior occurs
- d. method for testing hypotheses

ANSWER: c

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Understand

8. A common misconception that people have about psychology is that ____.

- a. it involves the use of the scientific method
- b. nearly all psychologists are involved in counseling
- c. psychologists study behavior but ignore the underlying biology
- d. psychologists only study abnormal behavior

ANSWER: d

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Understand

9. Many people have misconceptions about psychology. This fact suggests that psychology is ____.

- a. not a science
- b. merely a collection of random theories
- c. more than just common sense
- d. rarely applicable to everyday life

ANSWER: c

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Thinking Critically

10. Which statement is best classified as pseudopsychology?

- a. By visualizing that a cancerous tumor is dying, you can cure yourself of cancer without chemotherapy.
- b. Research published in professional journals shows that dogs can detect the scent of certain cancers.
- c. A number of studies of childhood cancers show that there can be psychological effects long after successful treatment has ended.
- d. According to research, successful pain control for persons with terminal cancer is possible.

ANSWER: a

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Thinking Critically

11. What is a common myth about psychology?

- a. Psychology includes the study of the biological basis of behavior.
- b. Psychology studies both abnormal and normal development.
- c. Psychological theories can be used to explain both normal and abnormal behavior.
- d. Psychology does not involve true experimental research because it cannot.

ANSWER: d

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Thinking Critically

12. What is the best example of a pseudopsychological finding?

- a. Studies show you a relationship between academic achievement and class attendance.
- b. Research suggests that we tend to be attracted to people who are similar to us.
- c. Surveys have found that men tend to report falling in love faster than women.
- d. We use only 10% of our brains and therefore, nearly everyone is actually a genius.

ANSWER: d

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Application

13. Who is engaging in critical thinking?

- a. Thomas, who typically develops a list of pros and cons for any important decision
- b. Celeste, who relies on Consumer Reports for information about which product to purchase
- c. Dalton, weighs only expert opinions when making important decisions
- d. Maria, who goes with her gut when deciding which new car to buy

ANSWER: a

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Thinking Critically

14. A scientific theory ____.

- a. is typically a gross oversimplification
- b. rarely has a basis in experimentation
- c. provides a summary to guide thinking
- d. has no practical, real life importance

ANSWER: c

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Understand

15. The process of analyzing and evaluating information and applying it to other situations is known as ____.

- a. critical thinking
- b. pseudopsychology
- c. sensation and perception
- d. human factors research

ANSWER: a

POINTS: 1

REFERENCES: 1.1 What Is Psychology?

KEYWORDS: Bloom's: Understand

16. One of the four goals of psychology is to ____.

- a. replicate
- b. observe
- c. interpret
- d. predict

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

17. What list correctly states the four goals of psychology?

- a. observe, interpret, correlate, replicate
- b. monitor, survey, associate, experiment
- c. describe, predict, explain, control
- d. extract, inventory, analyze, change

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

18. Therapists and sports psychologists use psychology in order to help people change their behavior. This is an example of which goal of psychology?

- a. description
- b. prediction
- c. explanation
- d. control

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

19. Dr. O'Neill is interviewing parents about how they discipline their children in an attempt to outline the difference

between normal levels of punishment and abuse. Dr. O'Neill is attempting to satisfy which goal of psychology?

- a. describing behavior
- b. predicting behavior
- c. explaining behavior
- d. controlling behavior

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

20. Dr. Haupt has discovered that often, abusive parents themselves had parents who used harsh physical punishment on them. Having discovered this will most likely allow Dr. Haupt to fulfill which goal of psychology?

- a. predicting behavior
- b. describing behavior
- c. controlling behavior
- d. explaining behavior

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

21. Psychology is considered a science because it ____.

- a. relies on technology to conduct research
- b. uses a set of rules to gather and analyze information
- c. has generated a series of proven theories
- d. conducts laboratory and basic research studies

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

22. The scientific method is used by ____.

- a. all scientists, including psychologists
- b. the physical but not behavioral or social sciences
- c. experimental psychologists and scientists only
- d. medical scientists only

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

23. The first step of the scientific method is to ____.

- a. form a testable hypothesis
- b. analyze the data
- c. choose a research method
- d. make predictions about behavior

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

24. Which progression represents the correct sequence of steps in the scientific method?
- a. make predictions, form a hypothesis, choose a research strategy, conduct a study, analyze the data
 - b. conduct a study, analyze the data, form a hypothesis, publish conclusions, obtain feedback
 - c. choose a research strategy, determine desired results, conduct a study, form a hypothesis, analyze data
 - d. develop a theory, conduct an experiment to test the theory, analyze data, publish data

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

25. Psychologists usually attempt to determine whether or not data supports a hypothesis through the use of ____.
- a. intuition
 - b. statistics
 - c. reason
 - d. polygraphs

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

26. A hypothesis is ____.
- a. a statement describing the actual outcome of an experiment
 - b. the question that forms the foundation for a particular study
 - c. a statement describing what the researchers expect to find in a study
 - d. a type of research method that involves experimentation

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

27. Dr. Abaee wants to use the scientific method. What is his first task?
- a. Develop a hypothesis.
 - b. Propose a theory.
 - c. Design an experiment.
 - d. Make predictions.

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

28. In the scientific method, after making a prediction, the next step is to ____.

- a. conduct a study
- b. analyze the data
- c. form a testable hypothesis
- d. develop a theory

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

29. Hypotheses can fall into one of two categories: ____.

- a. analytical and anecdotal
- b. accidental and purposeful
- c. controllable and uncontrollable
- d. predictive and causal

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

30. Predictive hypotheses are used to address which two goals of psychology?

- a. understanding and predicting
- b. testing and controlling
- c. describing and predicting
- d. manipulating and controlling

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

31. Which statement illustrates a causal hypothesis?

- a. Students who get more sleep do better on tests.
- b. The amount of alcohol consumed will influence the ability to walk a straight line.
- c. There is a relationship between the number of hot dogs people eat and their rate of cancer.
- d. Shorter men tend to have higher incomes than taller men.

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

32. In order to test causal hypotheses, the researcher must use ____.

- a. case studies
- b. experiments
- c. naturalistic studies
- d. correlational studies

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

33. Dr. Lowrey is testing the hypothesis that the more education a person has, the more money he or she will earn. Dr. Lowrey is testing a ____ hypothesis

- a. true
- b. causal
- c. predictive
- d. factual

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

34. Dr. Masood is conducting an experiment in which she is testing the effect of video game playing on the ability to think creatively. One group of children plays video games two hours a day for a week, another group of similar children plays video games for a total of two hours in a week, and a third group of children do not play video games at all. All three groups of children then take a test measuring their creativity. The hypothesis that Dr. Masood is testing is best described as a ____ hypothesis.

- a. predictive
- b. control
- c. causal
- d. behavioral

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

35. Causal hypotheses are most closely associated with which goal of psychology?

- a. analysis
- b. prediction
- c. explanation
- d. description

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

36. Causal hypotheses can only be tested when the researcher has the ability to ____ the main variables of the study.

- a. predict or assess
- b. control or manipulate
- c. identify or understand
- d. estimate or measure

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

37. The hypothesis, "Having an efficient digestive system will lead to obesity in rats," is an example of a(n) ____ hypothesis.

- a. predictive
- b. causal
- c. factual
- d. untestable

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

38. Researchers use random sampling to obtain a(n) ____.

- a. population of interest
- b. experimental sample
- c. control group
- d. representative sample

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

39. If you have to do a research project for your psychology class and you use your roommates and family members as participants, you are using a ____.

- a. sample of convenience
- b. control sample
- c. random sample
- d. representative sample

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

40. Samples of convenience are ____.

- a. unacceptable in psychology
- b. not random
- c. best for experiments
- d. especially useful for causal hypotheses

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

41. When conducting their research, psychologists attempt to obtain a ____ that is representative of their ____.

- a. population of interest; sample
- b. sample; population of interest

c. control group; experimental group

d. experimental group; control group

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

42. Reactivity presents the biggest problem in ____.

a. case studies

b. experiments

c. archival studies

d. naturalistic observations

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

43. Naturalistic observations are predominantly used to achieve the goals of ____.

a. prediction and control

b. explanation and prediction

c. description and prediction

d. explanation and control

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

44. To minimize reactivity, researchers conducting naturalistic observations may ____.

a. attempt to control the variable being studied

b. inform the participants in the study about the hypotheses being tested

c. debrief participants extensively

d. observe from a discrete distance or via a video feed

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

45. A case study involving a person with 53 different personalities, although valuable in some ways, is unlikely to be ____.

a. accountable

b. valid

c. significant

d. generalizable

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

46. One of the biggest disadvantages of case studies is a lack of ____.

- a. depth and breadth of detail
- b. generalizability
- c. usefulness with rare conditions
- d. flexibility

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

47. What do naturalistic observations, case studies, and correlational studies all have in common?

- a. They are used to test causal hypotheses.
- b. They do not allow the researcher to control the main variables in the study.
- c. They are most likely to be used by biological psychologists.
- d. They are all non-scientific.

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

48. Dr. Kushman is doing an in-depth study on one of his clients who has had a significant change in personality since being hit in the head by a foul ball at a baseball game. Dr. Kushman is conducting a ____.

- a. naturalistic observation
- b. survey
- c. case study
- d. experiment

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

49. Surveys are often used to test ____ hypotheses.

- a. predictive
- b. causal
- c. factual
- d. experimental

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

50. A correlation coefficient is a number that indicates ____.

- a. the degree of causation between one variable and another
- b. the amount of difference between two pieces of data

- c. the strength of a relationship between two factors
- d. whether a particular result is statistically significant or not

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

51. Which correlation coefficient would best fit a finding that as variable A increases, variable B increases almost to the same degree?

- a. $+.80$
- b. $-.20$
- c. $+.20$
- d. $-.80$

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

52. Suppose that Dr. Poonnamalee finds a correlation of $+.68$ between the amount of humor professors use and the grades that students earn in their classes. What can he appropriately conclude from this finding?

- a. There is no meaningful relationship between these two variables.
- b. Greater use of humor is associated with higher grades.
- c. Greater use of humor is associated with lower grades.
- d. Humor, or the lack of it, causes student grades to be higher or lower.

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

53. Students who participate more hours in study groups tend to do better in their classes, as measured by their GPAs. This association would be an example of a ____.

- a. negative correlation
- b. positive correlation
- c. cause and effect relationship
- d. chance event

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

54. A negative correlation describes a relationship in which ____.

- a. one variable has no effect on another variable
- b. one variable decreases while another variable increases
- c. two variables increase together
- d. two variables decrease together

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

55. Because researchers do not control the main variables in a correlational study, ____.
- a. the research is not considered to be scientific
 - b. the data drawn from the study will be random occurrences
 - c. they are unable to determine which variable causes the other
 - d. they have a greater chance of discovering the real relationship between the variables

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

56. The two main features of an experiment are ____.
- a. hypothesis formation and data collection
 - b. random assignment and control
 - c. prediction and manipulation
 - d. data collection and statistical analysis

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

57. If a research study involves the manipulation of one of the main variables, the study is most likely a(n) ____.
- a. experiment
 - b. case study
 - c. correlational study
 - d. naturalistic observation

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

58. The point of an experiment is to ____.
- a. observe what happens in a natural environment
 - b. ask predetermined questions and record the responses
 - c. determine if one variable is associated with another variable
 - d. manipulate one variable to see its effects on another variable

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

59. The independent variable is to the dependent variable as ____ is to ____.
- a. uncontrolled; controlled

- b. cause; effect
- c. criterion; predictor
- d. outcome; input

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

60. Which statement is TRUE regarding the independent variable in an experiment?

- a. It is the variable that the experimenter manipulates.
- b. It is the effect that is a constant.
- c. It is the effect in the experiment.
- d. It is the variable that is allowed to vary on its own.

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

61. The dependent variable ____.

- a. is the variable manipulated by the experimenter
- b. is the cause of the outcome
- c. needs to be controlled by the experimenter
- d. shows the effect of the manipulation

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

62. Consider an experiment in which participants watch various types of TV programming and are then observed while playing a physical game to determine the number of aggressive acts they commit. In this example, the dependent variable would be the ____.

- a. gender of the participants
- b. game played by the participants
- c. type of TV programming watched
- d. number of aggressive acts observed

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

63. Dr. Ikeda conducts an experiment on the effect of physical beauty on being hired for a job, and has both attractive and unattractive individuals apply for the same job. However, he fails to control for the possibility that the attractive applicants have better resumes. In this case, the quality of the resumes is considered a(n) ____.

- a. confounding variable
- b. dependent variable
- c. experimental variable
- d. independent variable

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

64. In ____, neither experimenters nor participants know whether the participant is in the experimental or control group.

- a. double-blind studies
- b. case studies
- c. naturalistic observation
- d. survey research

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

65. The fact that many psychological studies are conducted using college students as participants is relevant when considering ____.

- a. how important it is to obtain a college education
- b. the popularity of psychology as a major in college
- c. if the results can be generalized to the rest of the population
- d. if the scientific method was actually followed in the administration of the study

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

66. Dr. Bozzo wants to test the hypothesis that eating a high protein diet leads to greater weight loss than a high carbohydrate diet. Which type of research design would Dr. Bozzo be most likely to use?

- a. an experiment
- b. a survey
- c. naturalistic observation
- d. a correlational study

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

67. Confounding variables ____.

- a. are always controlled in correlational studies
- b. can lead to alternative explanations for the results of a study
- c. are possible effects other than the one hypothesized
- d. are only of concern in case studies

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

68. To make sure that groups of participants in an experiment are not generally different from each other before the experiment begins, the experimenter ____.

- a. uses an objective observer to assign participants to groups
- b. uses random assignment to assign participants to groups
- c. assigns participants to groups by himself or herself without interference by anyone else
- d. assigns participants to groups on the basis of an unimportant trait such as hair color

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

69. In a random sample, ____.

- a. the independent variable is administered randomly to the participants in the study
- b. participants are chosen to be included in the study based on personal characteristics
- c. participants are taken on a volunteer basis only
- d. every member of the population has an equal chance of being a participant in the study

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

70. Random assignment is to ____ as random sampling is to ____.

- a. control of confounding variables; representative population
- b. representative population; control of confounding variables
- c. experiment; quasi-experiment
- d. quasi-experiment; experiment

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

71. The effect of confounding variables is greatly reduced through ____.

- a. random sampling
- b. utilizing several dependent variables
- c. conducting a quasi-experiment
- d. random assignment

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

72. Quasi-experiments are studies which ____.

- a. rely on surveys and naturalistic observations
- b. involve random assignment, but no manipulation of the main variables
- c. involve random sampling, but no manipulation of the main variables

d. involve manipulation of the main variables, but no random assignment

ANSWER: d

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

73. What is an important disadvantage of experiments?

- a. Experiments do not do a good job of explaining the relationships between the variables studied.
- b. Experiments require a great deal of technology to conduct, which makes them more expensive to conduct than other types of studies.
- c. Some experiments cannot be conducted because to do so would be unethical.
- d. The American Psychological Association requires that only those with doctoral degrees can conduct experiments, which means that many people cannot do them.

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

74. In contrast to experiments, naturalistic observations are typically ____.

- a. more conclusive
- b. less artificial
- c. less random
- d. more scientific

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Thinking Critically

75. Dr. Townsend wants to test the hypothesis that being tall for your age predicts that you will be shy. Which of the following types of research would Dr. Townsend be least likely to use?

- a. an experiment
- b. a case study
- c. naturalistic observation
- d. a correlational study

ANSWER: a

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

76. Dr. Ford wants to test the hypothesis that room color can affect memory. To that end, he randomly assigns 10 students to a condition where they study a written passage while seated in a room that is painted a lilac color. The other 10 students study the passage while seated in an identical room that is painted bright orange. After both groups studied the passage for one hour, they are given a multiple-choice test over the material. Dr. Ford then calculates how many questions the students in both groups answer correctly. Dr. Ford's study is an example of a(n) ____.

- a. correlational study
- b. naturalistic observation
- c. experiment

d. case study

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

77. Dr. Ford wants to test the hypothesis that room color can affect memory. To that end, he randomly assigns 10 students to a condition where they study a written passage while seated in a room that is painted a lilac color. The other 10 students study the passage while seated in an identical room that is painted bright orange. After both groups studied the passage for one hour, they are given a multiple-choice test over the material. Dr. Ford then calculates how many questions the students in both groups answer correctly. In Dr. Ford's study, the independent variable is ____.

- a. the people who studied the passage while seated in the lilac room
- b. the color of the room in which the students studied the passage
- c. the test scores of the students
- d. whether or not the students were able to recall information about the passage

ANSWER: b

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

78. Dr. Ford wants to test the hypothesis that room color can affect memory. To that end, he randomly assigns 10 students to a condition where they study a written passage while seated in a room that is painted a lilac color. The other 10 students study the passage while seated in an identical room that is painted bright orange. After both groups studied the passage for one hour, they are given a multiple-choice test over the material. Dr. Ford then calculates how many questions the students in both groups answer correctly. In Dr. Ford's study, a potential confounding variable is the ____.

- a. students' test scores
- b. color of the room in which the students studied the passage
- c. age of the students
- d. random assignment to groups

ANSWER: c

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Apply

79. Dr. Ford wants to test the hypothesis that room color can affect memory. To that end, he randomly assigns 10 students to a condition where they study a written passage while seated in a room that is painted a lilac color. The other 10 students study the passage while seated in an identical room that is painted bright orange. After both groups studied the passage for one hour, they are given a multiple-choice test over the material. Dr. Ford then calculates how many questions the students answer correctly. He finds that students in the lilac-room condition score much better than the students in the orange-room condition. Based on this study, what can Dr. Ford conclude?

- a. Room color predicts, but does not cause a change in, memory performance.
- b. Room color causes a change in memory performance.
- c. Students like cool colors better than warm ones.
- d. Warm colors make students angry.

186. Examine three misconceptions people commonly hold about psychology. Refute these misconceptions based on what you have learned about what psychology is, and how psychologists actually engage in studying the human experience.

ANSWER: Answers will vary. People often think that psychologists are solely focused on helping people through counseling and diagnosing mental illness. A number of people also believe that psychology is based largely on how one feels about things. Many people assume that psychology is just good, old-fashioned common sense. Actually, psychology, is a field of study which focuses on a wide variety of human behavior and mental processes, including; learning, emotions, social influences, and the brain—just to name a few. Psychology strives to look beyond mere personal experience through the use of research strategies and the scientific method—just as all sciences do. Lastly, while psychology certainly does validate so-called “common sense” beliefs, psychology also examines events and experiences which go against commonly held beliefs.

187. List the four goals of psychology and provide an example of each one.

ANSWER: Though psychologists study and emphasize different aspects of behavior, they all share similar goals. The main goals of psychology and psychological research are as follows:

- To describe behavior
- To predict behavior
- To explain behavior
- To control or change behavior

Examples will vary.

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

188. Describe the steps involved in the scientific method.

ANSWER:

1. Define and describe the issue to be studied. You might hypothesize that college students who buy pitchers of beer tend to drink more than college students who purchase bottles of beer (a prediction). You study previous research in scientific journals on alcohol consumption.
2. Form a testable hypothesis. Students who buy pitchers of beer tend to drink more than students who buy beer in bottles. This hypothesis must be phrased in a way that can be objectively measured—that is, in such a way that another person can test the same hypothesis to verify or replicate your results.
3. Choose an appropriate research strategy. You choose a group of people to observe (college students) and a research method that allows you to measure objectively how much beer students who buy pitchers drink versus how much beer students who buy bottles drink. You decide where your study will be conducted. Will it be in the environment where the behavior naturally occurs (such as the local college bar) or in a laboratory (a more controlled setting)? You decide who you will use as participants. Will you use animals or humans? If using humans, how will they be selected? If using animals, what species will you use?
4. Conduct the study to test your hypothesis. Run the study and collect the data based on the decisions in steps 1–3.
5. Analyze the data to support or reject your hypothesis. Researchers usually analyze their data using statistics. If the results do not support your hypothesis, you can revise the hypothesis or

pose a new one. If the results do support your hypothesis, you can replicate your study (do the same one again) to increase your confidence that your findings support your hypothesis or make additional predictions and test them. Geller, Russ, and Altomari (1986) actually included this prediction in a larger study on beer drinking among college students and found support for the hypothesis that buying pitchers was associated with consuming larger amounts of beer.

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

189. Describe one major advantage and one major disadvantage of experimental research designs.

ANSWER: Experiments have several advantages. First, it is only through experimentation that we can approach two of the goals of psychology: explaining and changing behavior. An experiment is the only research method that enables us to determine cause- and-effect relationships. This advantage makes interpreting research results less ambiguous. In an experiment, we attempt to eliminate any confounding variables through experimenter control and random assignment of participants to groups. These techniques enable us to draw clearer conclusions from research results.

Experiments also have disadvantages. First, experiments do not address the first two goals of psychology: describing and predicting behavior. These are often the first steps in understanding behavior, and naturalistic observation, surveys, and correlational studies are quite useful for doing this. Second, in an attempt to control confounding variables, experiments conducted in laboratory settings may create an artificial atmosphere. It is then difficult to know whether the same result would occur in a more natural setting. This may be another reason to conduct naturalistic observations or correlational studies. Third, sometimes employing the experimental method is simply not possible for ethical or practical reasons.

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

190. Describe two research methods utilized by psychologists, including an example of each.

ANSWER: **Naturalistic observations** are research studies that are conducted in the environment in which the behavior typically occurs. While naturalistic observation can provide a picture of behavior as it normally occurs, researchers need to consider the influence of reactivity.

A case study is an in-depth observation of one participant. The participant may be a person, an animal, or even a setting such as a business or a school. As with naturalistic observation, in case studies researchers do not control any variables but merely record or relate their observations. Case studies provide in-depth information on rare and unusual conditions that we might not otherwise be able to study.

Often, psychologists want to study a whole group of people but in less depth. **Surveys** can accomplish this task by asking a large group of people about their attitudes, beliefs, and/or behaviors. A large group of people can quickly respond to questions or statements in their homes, online, over the phone, or out in public.

Correlational studies test the relationship, or correlation, between two or more variables—television watching and violent behavior, or depression and gender, for example. The researcher does not control variables but rather measures them to see whether any reliable relationship exists between them.

Although several types of research methods are used to test predictive hypotheses, only one research method can test a causal hypothesis: the **experiment**. Two main features characterize an experiment.

First, the variables in the study are controlled or manipulated. Second, participants are randomly assigned to the conditions of the study. When these two conditions have been met, causal conclusions may be drawn.

A **quasi-experiment** is in some ways like an experiment. The researcher manipulates the independent variable and sets the other conditions to be the same for both groups. However, the second requirement for an experiment—randomly assigning participants to conditions—has not been met.

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

191. Describe a real example of each of the following: a negative correlation, a positive correlation, and a zero correlation.

ANSWER: The sign before the correlation coefficient tells us how the variables relate to one another. A positive correlation means that as one variable increases, the other variable also tends to increase; or as one variable decreases, the other variable tends to decrease. In both cases, the variables are changing in the same direction. An example of a positive correlation is perceived stress and blood pressure. As perceived stress increases, so does one's blood pressure. In a negative correlation, as one variable increases, the other variable tends to decrease in what is referred to as an inverse relationship. Notice that the variables are changing in opposite directions. An example of a negative correlation is video game playing and school competence. The more time children spend playing video games, the poorer their competence is at school. A zero correlation would indicate there is no systematic relationship between two variables. For example, there is likely no systematic relationship between the number of hours a college student spends studying and his or her height.

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

192. Suppose you were interested in studying how the color of a room might affect student performance on exams. Describe the experiment you would design to investigate this, and be sure to indicate what the independent and dependent variables are in the study you chose, and how you might deal with the problem of confounding variables.

ANSWER: Answers will vary. To understand the effect of room color on student test performance, I would recruit a group of students from a large class to take their midterm exam in different rooms in smaller groups. If the class originally had about 50 students, I would assign groups of 25 students to take their exams in rooms that were either a warm (red) or cool (blue) color. I would then compare the performance of these two groups (warm versus cool room color) on the exam scores. The independent variable in this experiment is the color of the room in which the exam takes place (red or blue). The dependent variable in this experiment is the exam score. Of course, it is possible that students in the "warm" room might naturally be better test takers or students than those in the "cool" room—or vice versa, which would present another explanation for any results. To minimize the effect of such confounding variables I would randomly assign students to conditions so that students' preferences, skills, and so forth would (hopefully) be evenly distributed across the two groups.

POINTS: 1

REFERENCES: 1.2 The Science of Psychology: Goals, Hypotheses, and Methods

KEYWORDS: Bloom's: Understand

193. Describe the procedures that psychological researchers use to ensure the ethical treatment of human participants.

ANSWER: Generally, psychologists affiliated with universities and colleges cannot conduct research unless their research proposal has passed review by an institutional review Board (IRB). The function of the IRB is to ensure that the research study being proposed conforms to a set of ethical standards or guidelines.

Another fundamental principle of ethical practice in research is informed consent. Researchers inform potential participants of any risks during the informed consent process, wherein the researcher

establishes a clear and fair agreement with research participants prior to their participation in the research study (APA, 2002). This agreement clarifies the obligations and responsibilities of the participants and the researchers.

Prospective participants are also informed that they may withdraw from participation in the study at any time, and they are informed of any available treatment alternatives. In addition, the researcher agrees to maintain confidentiality. Personal information about participants obtained by the researcher during the course of the investigation cannot be shared with others unless explicitly agreed to in advance by the participant or as required by law or court order.

It is not always possible to fully inform participants of the details of the research, as it may change their behavior. For this reason, psychologists sometimes use deception in their research. If participants have been deceived in any way during the course of a study, the researcher is obligated to debrief participants after the experiment ends. Debriefing consists of full disclosure by the researcher to inform participants of the true purpose of the research. Any misconceptions that the participant may hold about the nature of the research must be removed at this time.

POINTS: 1

REFERENCES: 1.3 Ethical Principles of Psychological Research

KEYWORDS: Bloom's: Understand

194. Place yourself in the place of a member of an Institutional Review Board (IRB). What would you be looking for in a research proposal from a psychologist?

ANSWER: Answers will vary. One of the most important points the research proposal needs to address is informed consent. Potential participants require a general idea of the study, any aspect which might influence their decision to participate, issues of compensation, and an assessment of risks for participating. Participants also require notification of their rights to withdraw from the study at any time for any reason. The issue of confidentiality must be addressed in an explicitly agreed upon manner. If deception is proposed, a process for debriefing must be provided to the IRB. For non-human subjects, animals must be treated in a manner which allows for comfort, care, and health. Any discomfort, pain, illness, etc. must be shown to be vitally necessary to the research with no other alternative available. Animal participants with the capacity for higher-order psychological capacity must be cared for in a manner which protects their psychological health.

POINTS: 1

REFERENCES: 1.3 Ethical Principles of Psychological Research

KEYWORDS: Bloom's: Understand

195. Today, psychology is defined as the study of mental processes and behavior. How have the works of early schools of thought (e.g., Wilhelm Wundt's structuralism, William James's functionalism, Sigmund Freud's psychoanalysis, and John Watson's behaviorism) contributed to today's definition of psychology?

ANSWER: Answers will vary. Wundt emphasized studying the conscious areas of the mind which allowed for the exploration of mental processes, such as sensations and perceptions; elements he thought when put together would explain mental processes. Freud was also interested in studying mental processes, but he believed the key to understanding the human mind lay in understanding the unconscious, which he believed could be explored through the techniques of psychoanalysis. On the other hand, William James, was interested in comprehending how specific behaviors helped an organism adapt to its surroundings and was very interested in studying the functional impact of behavior. John Watson believed that only observable stimuli and responses constituted the proper study for psychology. Thus, Wundt and Freud helped to further the understanding of mental process, while James and Watson contributed to our further understanding of external, public behaviors. Together the two main divisions of mental processes and behavior came to represent the domain of psychology.

POINTS: 1

REFERENCES: 1.4 Psychology in the Modern World: Foundations and Growth

KEYWORDS: Bloom's: Understand

196. Compare and contrast the psychoanalytic perspective and the behavioral perspective.

ANSWER: Freud's focus on the unconscious was unique and led to his formulation of psychoanalytic theory. According to this theory, humans are similar to animals in that they possess basic sexual and aggressive instincts that motivate behavior. However, unlike animals, humans can reason and think, especially as they mature. In childhood we learn to use these conscious reasoning abilities to deal with and to suppress our basic sexual and aggressive desires so that we can be viewed approvingly by others. For Freud, the conflict between the conscious reasoning part of the mind and the unconscious instinctual one was key to understanding human behavior.

In the 1920s, in the United States, a growing number of psychologists believed that in order for psychology to be taken seriously as a "true" science, it must focus on observable behavior and not on the mind, a school of thought referred to as behaviorism. You can't see the mind or what a person thinks; you can only see what a person does. Behaviorists believed that only overt, observable behaviors could truly be measured consistently from person to person. One of the most vocal proponents of this school of thought was American psychologist John B. Watson (1878–1958).

POINTS: 1

KEYWORDS: Bloom's: Understand

197. Briefly describe the beginning of scientific psychology, including who was involved, what was studied, and the nature of the studies.

ANSWER: Traditionally, psychology's birth is linked with the first psychology laboratory, which was established by Wilhelm Wundt in 1879 at the University of Leipzig, in Germany. Wundt (1832–1920), wanted to know what conscious thought processes enable us to experience the external world. In particular, Wundt attempted to detail the structure of our mental experiences. Wundt's view that mental experiences were created by different elements is referred to as structuralism, a term coined not by Wundt but by his student Edward Titchener.

To identify the structure of thought, British psychologist Titchener (1867–1927) used a process known as introspection, a self-observation technique. Trained observers were presented with an event and asked to describe their mental processes. The observations were repeated many times. From these introspections, Titchener identified three basic elements of all conscious experiences: sensations, images, and feelings.

198. Explain the typical process needed to become a psychologist. Describe the educational requirements, training, and possible work environments of a psychologist. Be sure to mention at least two different degrees that lead to being considered a psychologist.

ANSWER: Answers will vary. The degree level for most psychologists is a doctorate. The doctorate is generally either a Ph.D. (Doctor of Philosophy) in psychology; or, a Psy.D. (Doctor of Psychology). The Ph.D. usually concentrates more on research, while the Psy.D. centers around clinical training. Either of these degrees requires 5-7 years of additional study after obtaining a bachelor's degree. All psychologists are trained in research and statistics. Some psychologists work in assessing and treating individuals for adjustment problems and mental health disorders. Other psychologists engage in research and teaching and do not counsel or otherwise treat people. Psychologists work in schools, businesses, government, hospitals and other places—including self-employment.

POINTS: 1

REFERENCES: 1.4 Psychology in the Modern World: Foundations and Growth

KEYWORDS: Bloom's: Understand

199. Describe two specialty areas of psychology, including the kinds of behavior that would interest them the most.

ANSWER: Answers will vary, but may include two from the following:

Biopsychology: Researches the biological processes that underlie behavior, including genetic, biochemical, and nervous system functioning.

Clinical psychology: Researches, assesses, and treats children, adolescents, and adults who are experiencing difficulty in functioning or who have a serious mental health disorder such as schizophrenia.

Cognitive psychology: Studies mental processes such as decision making, problem solving, language, and memory.

Community psychology: Seeks to understand and enhance the quality of life for individuals, communities, and society. Focuses on early intervention in and prevention of individual and community problems.

Counseling psychology: Researches, assesses, and treats children, adolescents, and adults who are experiencing adjustment difficulties.

Cross-cultural psychology: Investigates cultural similarities and differences in psychological traits and behaviors.

Developmental psychology: Researches how we develop physically, cognitively, socially, and emotionally over the life span.

Educational psychology: Researches how people learn and how variables in an educational environment influence learning. May develop materials and strategies to enhance learning.

Environmental psychology: Examines the relationship between environments and human behavior. Focuses on designing, managing, protecting, and/or restoring the environment to enhance behavior. Also studies environmental attitudes, perceptions, and values to promote environmentally appropriate behavior.

Experimental psychology: Conducts research on sensation, perception, learning, motivation, and emotion.

Forensic psychology: Works with mental health issues within the context of the legal system. May study a certain type of criminal behavior such as rape or murder, or may be asked to determine a person's competence to stand trial.

Health psychology: Researches ways to promote health and prevent illness. May be concerned with issues such as diet and nutrition, exercise, and lifestyle choices that influence health.

Human factors psychology: Researches human capabilities as they apply to the design, operation, and maintenance of machines, systems, and environments to achieve optimal performance (for example, designing the most effective configuration of control knobs in airplane cockpits for pilots).

Industrial/ organizational (I/O) psychology: Examines the relationship between people and their work environments. May study issues such as increasing job satisfaction or decreasing employee absenteeism, or focus on understanding the dynamics of workplace behavior, such as leadership styles or gender differences in management styles.

Personality psychology: Researches how people differ in their individual traits, how people develop personality, whether personality traits can be changed, and how these qualities can be measured.

Positive psychology: Seeks to discover and promote those factors that contribute to happiness, positive emotions, and well-being.

School psychology: Assesses students' psychoeducational abilities (academic achievement, intelligence, cognitive processing) and shares test results with teachers and parents to help them make decisions regarding the best educational placement for students.

Social psychology: Researches how our beliefs, feelings, and behaviors are influenced by others, whether in the classroom, on an elevator, on the beach, on a jury, or at a football game.

Sports psychology: Investigates the mental and emotional aspects of physical performance.

200. Compare and contrast the humanistic perspective and the behavioral perspective.

ANSWER:

Psychologists may adopt a behavioral perspective that focuses on external causes of behavior. It looks at how stimuli in our environment and/or the rewards and punishments we receive influence our behavior and mental processes. This approach suggests that behavior is learned and is influenced by other people and events. For example, if a student studies and then passes an exam, that reward may encourage her to study again the next time. If she only gets an average score, merely passing the test may not be rewarding enough to encourage the student to study for future exams.

Psychologists who adopt a humanistic perspective explain behavior as stemming from your choices and free will. These choices are influenced by your self-concept (how you think of yourself) and by your self-esteem (how you feel about yourself). This view of the self and these feelings toward the self will lead you to choose certain behaviors over others. For example, if you see yourself as a low achiever in school, you may be less likely to take challenging courses or to apply yourself in the courses that you do take.
