http://testbanklive.com/download/business-statistics-in-practice-7th-edition-bowerman-solutions-manual/ Chapter 02 - Descriptive Statistics: Tabular and Graphical Methods

# **CHAPTER 2—Descriptive Statistics: Tabular and Graphical Methods**

**2.1** Constructing either a frequency or a relative frequency distribution helps identify and quantify patterns in how often various categories occur.

L02-01

**2.2** Relative frequency of any category is calculated by counting the number of occurrences of the category divided by the total number of observations. Percent frequency is calculated by multiplying relative frequency by 100.

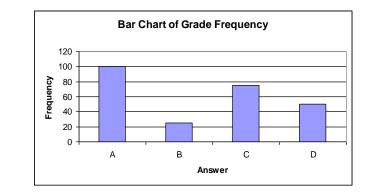

L02-01

2.3 Answers and examples will vary.

L02-01

2.4 a.

	Relative	Percent
Frequency	Frequency	Frequency
100	0.40	40%
25	0.10	10%
75	0.30	30%
50	0.20	20%
	100 25 75	Frequency Frequency   100 0.40   25 0.10   75 0.30

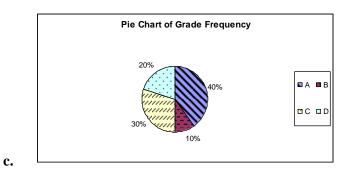

b.

L02-01

**2.5 a.** (100 / 250) \* 360 degrees = 144 degrees

**b.** (25 / 250) \* 360 degrees = 36 degrees

## Full download all chapters instantly please go to Solutions Manual, Test Bank site: testbanklive.com

**2.6** a. Relative frequency for product x is 1 - (0.15 + 0.36 + 0.28) = 0.21

b.	Product:	W	Х	Y	Ζ
		75	105	180	140

c.

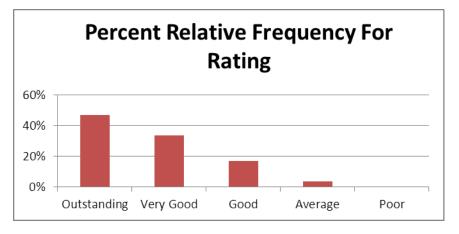

**d.** Degrees for W would be 54, for X degrees would be 75.6, for Y 129.6, and for Z 100.8.

L02-01

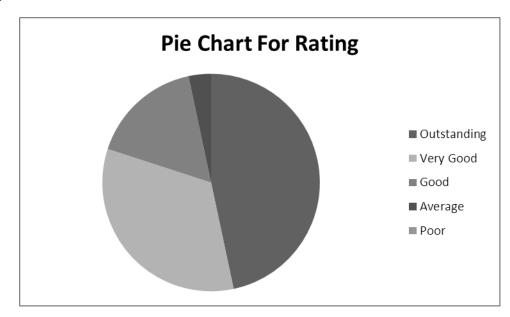

2.7	a.	Rating	Frequency	Relative Frequency
		Outstanding	14	0.467
		Very Good	10	0.333
		Good	5	0.167
		Average	1	0.033
		Poor	0	0.000
	-			

b.

2-2

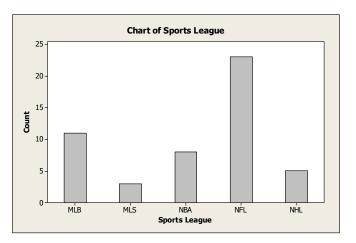

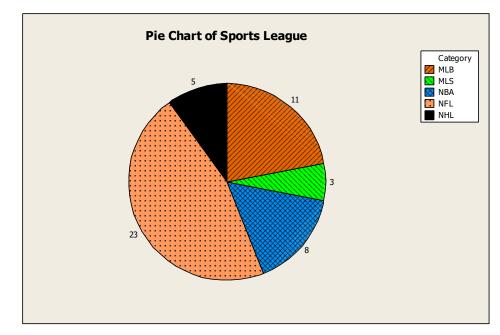

# 2.8 a. Tally for Discrete Variables: Sports League

Sports			Rel.	
League	Count		Freq.	Percent
MLB	11		0.22	22.00
MLS	3		0.06	6.00
NBA	8		0.16	16.00
NFL	23		0.46	46.00
NHL	5		0.10	10.00
		N=	50	

b.

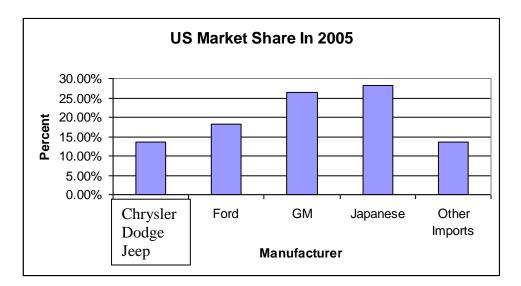

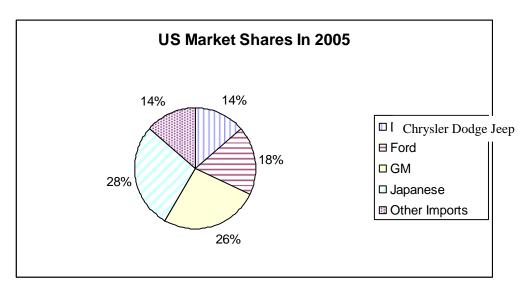

**d.** Most popular league is NFL and least popular is MLS.

2.9

2.12

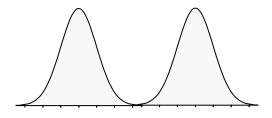

2.13

2.14

2.15

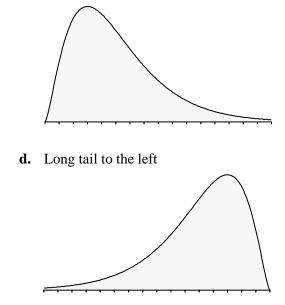

L02-01 32.29% a. 4.17% b. Explanations will vary c. L02-02 We construct a frequency distribution and a histogram for a data set so we can gain some a. insight into the shape, center, and spread of the data along with whether or not outliers exist. **b.** A frequency histogram represents the frequency in a class using bars while in a frequency polygon the frequencies in consecutive classes are connected by a line. c. A frequency ogive represents a cumulative distribution while the frequency polygon is not a cumulative distribution. Also, in a frequency polygon the lines connect the class midpoints while in a frequency ogive the lines connect the upper boundaries of the classes. L02-03 a. To find the frequency for a class you simply count how many of the observations are greater than or equal to the lower boundary and less than the upper boundary. **b.** Once you get the frequency for a class the relative frequency is obtained by dividing the class frequency by the total number of observations (data points). **c.** Percent frequency for a class is calculated by multiplying the relative frequency by 100. L02-03 **a.** One hump in the middle; left side looks like right side.

- **b.** Two humps, left side may or may not look like right side.

2-6

**c.** Long tail to the right

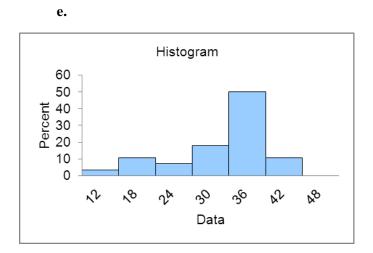

#### L02-03

- **2.16 a.** Since there are 28 points you should use 5 classes (from Table 2.5).
  - **b.** Class Length (CL) = (46 17) / 5 = 6
  - **c.**  $17 \le x < 23, 23 \le x < 29, 29 \le x < 35, 35 \le x < 41, 41 \le x < 47$

d.

# Frequency Distribution - Quantitative

	Data					-	cumula	ntive
lower		upper	midpoint	width	frequency	percent	frequency	percent
12	<	18	15	6	1	3.6	1	3.6

					40	100.0		

2-18

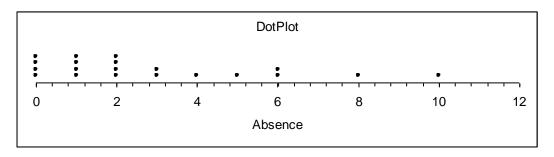

Distribution is skewed right.

L02-03

- 2.26 The horizontal axis spans the range of measurements and the dots represent the measurements. L02-04
- **2.27** A dot plot with a 1000 points is not practical. Use a histogram.

L02-03, L02-04

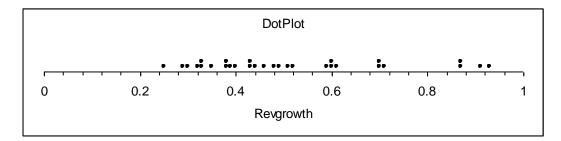

Distribution is concentrated between 0 and 2 and is skewed to the right. 10 and 8 are probably high outliers.

L02-04

<sup>© 2014</sup> by McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. This document may not be copied, scanned, duplicated, forwarded, distributed, or posted on a website, in whole or part.

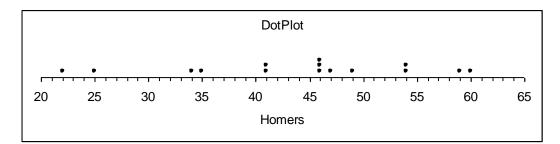

# 2.29

High outliers greater than 80%. Eliminating the high outliers the distribution is reasonably symmetric.

L02-04

## 2.30

Low outliers 22 and 25. Without outliers distribution is reasonably symmetric.

L02-04

**2.31** A stem & leaf enables one to see the shape of the distribution and still see all the measurements where in a histogram you cannot see the values of the individual measurements.

L02-03, L02-05

<sup>© 2014</sup> by McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. This document may not be copied, scanned, duplicated, forwarded, distributed, or posted on a website, in whole or part.

2.32 --Displays all the individual measurements. --Puts data in numerical order --Simple to construct

L02-05

**2.33** With a large data set (eg 1000 measurements) it does not make sense to do a stem & leaf because it is impractical to write out 1000 leafs. Should use a histogram.

L02-03, L02-05

#### 2.34

3	47	000
<u>1</u>	48	0
65		

- **b.** Distribution is slightly skewed to the left.
- **c.** Since 19 of the ratings are below 42 it would not be accurate to say that almost all purchasers are very satisfied.

L02-05

2.42 Cross tabulation tables are used to study association between categorical variables.

L02-06

**2.43** Each cell is filled with the number of observations that have the specific values of the categorical variables associated with that cell.

L02-06

2.44 Row percentages are calculated by dividing the cell frequency by the total frequency for that particular row. Column percentages are calculated by dividing the cell frequency by the total frequency for that particular column. Row percentages show the distribution of the column categorical variable for a given value of the row categorical variable. Column percentages show the distribution of the row categorical variable for a given value of the column categorical variable. L02-06

#### 2.45

c.

	TV Violence Inc.	TV Violence No Inc.
TV Quality Worse	50.2%	33.0%
TV Quality Not Worse	49.8%	67.0%
Total	100%	100%

**d.** Those people who think TV violence has increased are more likely to think TV quality has gotten worse.

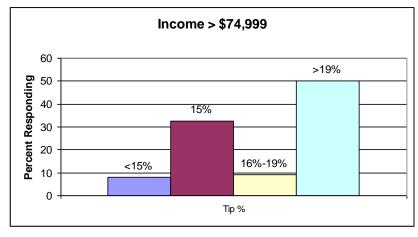

L02-01, L02-06

## 2.50 a.

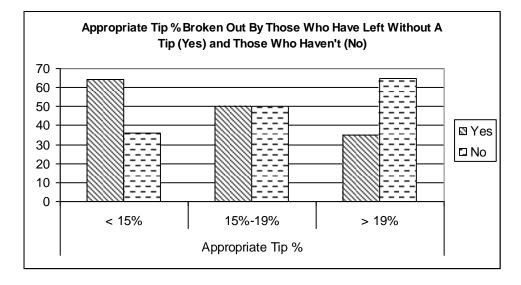

© 2014 by McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. This document may not be copied, scanned, duplicated, forwarded, distributed, or posted on a website, in whole or part.

**b.** As income rises the percent of people seeing larger tips as appropriate also rises.

L02-01, L02-06

## 2.51 a.

**b.** People who have left at least once without leaving a tip are more likely to think a smaller tip is appropriate.

L02-01, L02-06

**2.52** A scatterplot is used to look at the relationship between two quantitative variables.

L02-07

**2.53** Data are scattered around a straight line with positive slope.

L02-07

**2.54** Data are scattered around a straight line with negative slope.

L02-07

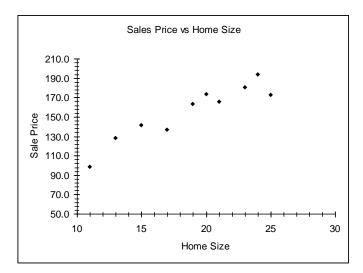

2.55 Data are scattered on the plot with the best line to draw through the data being horizontal.L02-07

**2.56** Scatter plot: each value of *y* is plotted against its corresponding value of *x*. Runs plot: a graph of individual process measurements versus time

L02-07

2.57 As home size increases, sales price increases in a linear fashion. A fairly strong relationship

L02-07

**2.58** As temperature increases, fuel consumption decreases in a linear fashion. A strong relationship.

L02-07

**2.59** Cable rates decreased in the early 1990's in an attempt to compete with the newly emerging satellite business. As the satellite business was increasing its rates from 1995 to 2005, cable was able to do the same.

L02-07

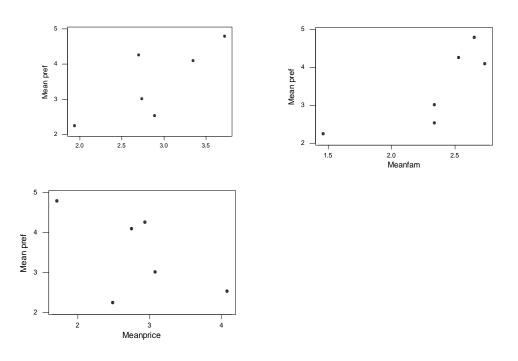

**2.60** Clearly there is a positive linear relationship here. As a brand gets more sales, retailers want to give more shelf space. Also as shelf space increases sales will tend to increase. Its difficult to determine cause and effect here.

L02-07

**2.61** The scatterplot shows that the average rating for taste is related to the average rating for preference in a positive linear fashion. This relationship is fairly strong.

The scatterplots below show that average convenience, familiarity, and price are all related in a linear fashion to average preference in a positive, positive, and negative fashion (respectively). These relationships are not as strong as the one between taste and preference.

L02-08

2.63 Examples and reports will vary.

L02-08

**2.64** The administration's plot indicates a steep increase over the four years while the union organizer's plot shows a gradual increase.

L02-08

- **2.65 a.** No, very slight (if any).
  - b. Yes, strong trend.
  - c. The line graph is more appropriate because it shows growth.
  - **d.** Probably not. Both distort the data.

L02-08

#### 2.66

Reports will vary but should focus on the Liberty model sales staying around 30% of total sales.

#### L02-01

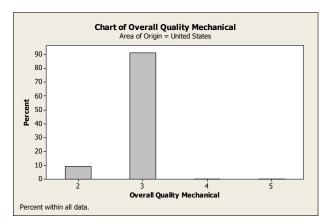

## **2.67** Large portion of manufacturers are rated 3.

Overall Mechanical	
Quality	frequency
1	0
2	6
3	23
4	2
5	2
	33
L02-	01

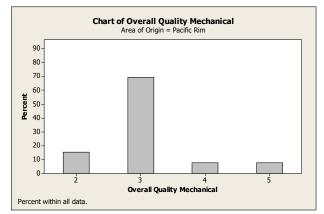

**2.68** Categories 3 & 4 cover large portion of companies.

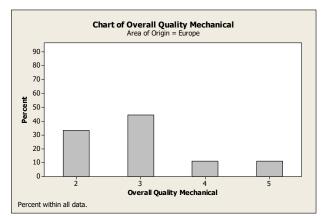

Overall Design Quality	frequency	percent
1	0	0.0
2	4	12.1
3	22	66.7
4	6	18.2
5	1	3.0
	33	100.0

#### L02-01

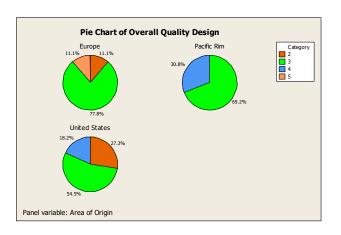

## **2.69** Written analysis will vary.
