

Chapter 12

12.1

$$\begin{aligned}y &= -0.16t^4 + 4.9t^3 + 0.14t^2 \text{ m} \\v &= \dot{y} = -0.64t^3 + 14.7t^2 + 0.28t \text{ m/s} \\a &= \dot{v} = -1.92t^2 + 29.4t + 0.28 \text{ m/s}^2\end{aligned}$$

At maximum velocity ($a = 0$):

$$-1.92t^2 + 29.4t + 0.28 = 0 \quad t = 15.322 \text{ s}$$

$$\begin{aligned}v_{\max} &= -0.64(15.322^3) + 14.7(15.322^2) + 0.28(15.322) \\&= 1153 \text{ m/s} \quad \blacktriangleleft \\y &= -0.16(15.322^4) + 4.9(15.322^3) + 0.14(15.322^2) \\&= 8840 \text{ m} \quad \blacktriangleleft\end{aligned}$$

12.2

$$(a) \quad x = -\frac{1}{2}gt^2 + v_0t \quad \therefore v = \dot{x} = -gt + v_0 \quad \blacklozenge \quad \therefore a = \ddot{x} = -g \quad \blacklozenge$$

When $t = 0$, then $x = 0$ and $v = v_0$. Hence v_0 is the initial velocity.

Since gravity is the only source of acceleration in this problem, g must be the gravitation acceleration.

$$(b) \quad \text{When } x = x_{\max} \text{ then } v = 0. \quad \therefore -gt + v_0 = 0 \quad \therefore t = \frac{v_0}{g}$$

$$\therefore x_{\max} = -\frac{1}{2}g\left(\frac{v_0}{g}\right)^2 + v_0\left(\frac{v_0}{g}\right) = \frac{v_0^2}{2g} \quad \blacklozenge$$

$$\text{At the end of flight } x = 0. \quad \therefore -\frac{1}{2}gt^2 + v_0t = 0 \quad \therefore t = \frac{2v_0}{g} \quad \blacklozenge$$

$$(c) \quad \therefore x_{\max} = \frac{(26.8)^2}{2(9.81)} = 36.6 \text{ m} \quad \blacklozenge \quad \therefore t = \frac{2(26.8)}{9.81} = 5.46 \text{ s} \quad \blacklozenge$$

12.3

$$\begin{aligned}x &= 6(1 - e^{-t/2}) \text{ m} \\v &= \dot{x} = 6\left(\frac{1}{2}e^{-t/2}\right) = 3e^{-t/2} \text{ m/s} \\a &= \dot{v} = -3\left(\frac{1}{2}e^{-t/2}\right) = -1.5e^{-t/2} \text{ m/s}^2\end{aligned}$$

(a) $x_{\max} = 6 \text{ m}$ at $t = \infty$ ◀

$v_{\max} = 3 \text{ m/s}$ and $|a|_{\max} = 1.5 \text{ m/s}^2$ both occurring at $t = 0$ ◀

(b) When $x = 3 \text{ m}$: $3 = 6(1 - e^{-t/2})$ $e^{-t/2} = 0.5$

$t = -2 \ln(0.5) = 1.3863 \text{ s}$ ◀

$v = 3(0.5) = 1.5 \text{ m/s}$ ◀ $a = -1.5(0.5) = -0.75 \text{ m/s}^2$ ◀

12.4

$$x = t^3 - 6t^2 - 32t \text{ m}$$

$$v = \dot{x} = 3t^2 - 12t - 32 \text{ m/s}$$

$$a = \dot{v} = 6t - 12 \text{ m/s}^2$$

At $t = 10 \text{ s}$:

$$x = 10^3 - 6(10^2) - 32(10) = 80 \text{ m} \quad \blacktriangleleft$$

$$v = 3(10^2) - 12(10) - 32 = 148 \text{ m/s} \quad \blacktriangleleft$$

$$a = 6(10) - 12 = 48 \text{ m/s}^2 \quad \blacktriangleleft$$

Reversal of velocity occurs when $v = 0$ ($t \neq 0$):

$$v = 3t^2 - 12t - 32 = 0 \quad t = 5.830 \text{ s}$$

$$x = 5.830^3 - 6(5.830^2) - 32(5.830) = -192.3 \text{ m}$$

At $t = 10 \text{ s}$ the distance travelled is

$$s = 192.3 + (192.3 + 80) = 466 \text{ m} \quad \blacktriangleleft$$

$$\begin{array}{c} \xleftarrow[5.83 \text{ s}]{-192.3 \text{ m}} \quad \xrightarrow[10 \text{ s}]{80 \text{ m}} \\ \quad \quad \quad 0 \end{array}$$

12.5 (a) $x = t^2 - \frac{t^3}{90} \text{ m}$ $v = \dot{x} = 2t - \frac{t^2}{30} \text{ m/s}$ $v = 0$ when $t = 60 \text{ s}$

$$x_{\max} = 60^2 - \frac{60^3}{90} = 1200 \text{ m} \quad \blacktriangleleft$$

(b) $a = \dot{v} = 2 - \frac{t}{15} \text{ m/s}^2$ $a = 0$ when $t = 30 \text{ s}$

$$v_{\max} = 2(30) - \frac{30^2}{30} = 30 \text{ m/s} \quad \blacktriangleleft$$

12.6

$$(a) \ x = v_0(t - t_0 + t_0 e^{-t/t_0}) \quad \therefore \ v = \dot{x} = v_0(1 - e^{-t/t_0}) \blacklozenge$$

Since $v \rightarrow v_0$ as $t \rightarrow \infty$, v_0 is the limiting or terminal velocity.

$$(b) \ a = \dot{v} = \frac{v_0}{t_0} e^{-t/t_0} \blacklozenge \quad \text{But from part (a): } v_0 - v = v_0 e^{-t/t_0} \quad \therefore \ a = \frac{v_0 - v}{t_0} \blacklozenge$$

12.7

$$x = 3t^2 - 12t \text{ m} \quad v = \dot{x} = 6t - 12 \text{ m/s}$$

(a) The bead leaves the wire when $x = 40$ m

$$3t^2 - 12t = 40 \quad t = 6.16 \text{ s} \blacktriangleleft$$

(b) Reversal of velocity occurs when $v = 0$ ($t \neq 0$):

$$\begin{aligned} v &= 6t - 12 & t &= 2.0 \text{ s} \\ x &= 3(2.0^2) - 12(2.0) = -12.0 \text{ m} \end{aligned}$$

The distance travelled is

$$s = 2(12) + 40 = 64.0 \text{ m} \blacktriangleleft$$

$$\begin{array}{ccc} -12 \text{ m} & 0 & 40 \text{ m} \\ \leftarrow & & \rightarrow \\ 2.0 \text{ s} & & 6.16 \text{ s} \end{array}$$

12.8

$$\begin{aligned} x &= 4t^2 - 2 \text{ mm} \\ y &= \frac{x^2}{12} = \frac{16t^4 - 16t^2 + 4}{12} = \frac{4t^4 - 4t^2 + 1}{3} \text{ mm} \end{aligned}$$

When $t = 2$ s:

$$\begin{aligned} v_x &= \dot{x} = 8t = 8(2) = 16 \text{ mm/s} \\ v_y &= \dot{y} = \frac{16t^3 - 8t}{3} = \frac{16(2)^3 - 8(2)}{3} = 37.33 \text{ mm/s} \\ v &= \sqrt{v_x^2 + v_y^2} = \sqrt{16^2 + 37.33^2} = 40.6 \text{ mm/s} \blacktriangleleft \end{aligned}$$

$$\begin{aligned} a_x &= \dot{v}_x = 8 \text{ mm/s}^2 \\ a_y &= \dot{v}_y = \frac{48t^2 - 8}{3} = \frac{48(2)^2 - 8}{3} = 61.33 \text{ mm/s}^2 \\ a &= \sqrt{a_x^2 + a_y^2} = \sqrt{8^2 + 61.33^2} = 61.9 \text{ mm/s}^2 \blacktriangleleft \end{aligned}$$

12.9

$$(a) \mathbf{x} = R \left(1 + \frac{1}{2} \cos \omega t \right) \quad \therefore \mathbf{v} = \dot{\mathbf{x}} = -\frac{1}{2} R \omega \sin \omega t \quad \blacklozenge \quad \therefore \mathbf{a} = \dot{\mathbf{v}} = -\frac{1}{2} R \omega^2 \cos \omega t \quad \blacklozenge$$

$$(b) |\mathbf{v}|_{\max} = \frac{1}{2} R \omega \quad |\mathbf{a}|_{\max} = \frac{1}{2} R \omega^2$$

$\therefore$ Doubling ω would double $|\mathbf{v}|_{\max}$ and quadruple $|\mathbf{a}|_{\max}$.

12.10

$$y = 50 - 2t \text{ s} \quad v_y = \dot{y} = -2 \text{ m/s} \quad a_y = \dot{v}_y = 0$$

$$x = \frac{6}{y} = \frac{6}{50 - 2t} \text{ m} \quad v_x = \dot{x} = \frac{3}{(25 - t)^2} \text{ m/s} \quad a_x = \dot{v}_x = \frac{6}{(25 - t)^3}$$

At $t = 20$ s:

$$v_x = \frac{3}{(25 - 20)^2} = 0.12 \text{ m/s} \quad v_y = -2 \text{ m/s} \quad \mathbf{v} = 0.12\mathbf{i} - 2\mathbf{j} \text{ m/s} \quad \blacktriangleleft$$

$$a_x = \frac{6}{(25 - 20)^3} = 0.048 \text{ m/s}^2 \quad a_y = 0 \quad \mathbf{a} = 0.048\mathbf{i} \text{ m/s}^2 \quad \blacktriangleleft$$

12.11

$$(a) v^2 = 2gr_0(r_0/r - 1) + v_0^2$$

Differentiate with respect to time: $2v\dot{v} = 2gr_0(-r_0/r^2)\dot{r}$ or $2v\mathbf{a} = -2g(r_0/r)^2\mathbf{v}$

$$\therefore \mathbf{a} = -g(r_0/r)^2 \quad \blacklozenge$$

(b) v_0 is the escape velocity if $v \rightarrow 0$ when $r \rightarrow \infty$.

$$\therefore 0 = \lim_{r \rightarrow \infty} [2gr_0(r_0/r - 1) + v_0^2] \quad \therefore 0 = 2gr_0(0 - 1) + v_0^2 \quad \therefore v_0 = \sqrt{2gr_0} \quad \blacklozenge$$

$$(c) \text{ For earth: } v_0 = \sqrt{2(9.81)(6340 \times 1000)} = 11153 \text{ m/s} \quad \blacklozenge$$

12.12

$$\begin{aligned} x &= 15 - 2t^2 \text{ m} & v_x &= \dot{x} = -4t \text{ m/s} & a_x &= \dot{v}_x = -4 \text{ m/s}^2 \\ y &= 15 - 10t + t^2 \text{ m} & v_y &= \dot{y} = -10 + 2t \text{ m/s} & a_y &= \dot{v}_y = 2 \text{ m/s}^2 \end{aligned}$$

$$(a) \text{ At } t = 0: \quad \mathbf{v} = -10\mathbf{j} \text{ m/s} \quad \blacktriangleleft \quad \mathbf{a} = -4\mathbf{i} + 2\mathbf{j} \text{ m/s}^2 \quad \blacktriangleleft$$

$$(b) \text{ At } t = 5 \text{ s:} \quad \mathbf{v} = -20\mathbf{i} \text{ m/s} \quad \blacktriangleleft \quad \mathbf{a} = -4\mathbf{i} + 2\mathbf{j} \text{ m/s}^2 \quad \blacktriangleleft$$

12.13

$$\begin{aligned}x &= 58t \text{ m} & v_x &= \dot{x} = 58 \text{ m/s} & a_x &= \dot{v}_x = 0 \\y &= 78t - 4.91t^2 \text{ m} & v_y &= \dot{y} = 78 - 9.82t \text{ m/s} & a_y &= \dot{v}_y = -9.82 \text{ m/s}^2\end{aligned}$$

(a) $\mathbf{a} = -9.82\mathbf{j} \text{ m/s}^2 \quad \blacktriangleleft$

(b) $\mathbf{v}|_{t=0} = 58\mathbf{i} + 78\mathbf{j} \text{ m/s} \quad \blacktriangleleft$

(c) $y = h$ when $v_y = 0$:

$$\begin{aligned}v_y &= 78 - 9.82t = 0 & t &= 7.943 \text{ s} \\h &= 78(7.943) - 4.91(7.943^2) = 310 \text{ m} \quad \blacktriangleleft\end{aligned}$$

(d) $x = L$ when $y = -140 \text{ m}$:

$$\begin{aligned}y &= 78t - 4.91t^2 = -140 & t &= 17.514 \text{ s} \\L &= 58(17.514) = 1016 \text{ m} \quad \blacktriangleleft\end{aligned}$$

12.14

$$y = \frac{x^2}{1000} \quad \frac{dy}{dx} = \frac{x}{500}$$

$$\begin{aligned}v_x &= v_0 \frac{1}{\sqrt{1 + (dy/dx)^2}} = \frac{v_0}{\sqrt{1 + (x/500)^2}} = \frac{500v_0}{\sqrt{500^2 + x^2}} \\v_y &= v_0 \frac{dy/dx}{\sqrt{1 + (dy/dx)^2}} = \frac{x/500}{\sqrt{1 + (x/500)^2}} = \frac{xv_0}{\sqrt{500^2 + x^2}}\end{aligned}$$

When $x = 100 \text{ m}$:

$$\begin{aligned}v_x &= \frac{500(6)}{\sqrt{500^2 + 100^2}} = 5.883 \text{ m/s} \\v_y &= \frac{100(6)}{\sqrt{500^2 + 100^2}} = 1.1767 \text{ m/s} \\ \mathbf{v} &= 5.88\mathbf{i} + 1.177\mathbf{j} \text{ m/s} \quad \blacktriangleleft\end{aligned}$$

$$a_x = \dot{v}_x = \frac{dv_x}{dx} \frac{dx}{dt} = \frac{dv_x}{dx} v_x = -\frac{500xv_0}{(500^2 + x^2)^{3/2}} v_x$$

$$a_y = \dot{v}_y = \frac{dv_y}{dx} \frac{dx}{dt} = \frac{dv_y}{dx} v_x = \frac{500^2 v_0}{(500^2 + x^2)^{3/2}} v_x$$

When $x = 100$ m:

$$a_x = -\frac{500(100)(6)}{(500^2 + 100^2)^{3/2}} (5.883) = -0.01331 \text{ m/s}^2$$

$$a_y = \frac{500^2(6)}{(500^2 + 100^2)^{3/2}} (5.883) = 0.0666 \text{ m/s}^2$$

$$\mathbf{a} = -0.01332\mathbf{i} + 0.666\mathbf{j} \text{ m/s}^2 \quad \blacktriangleleft$$

12.15

(a) $x = a \cos \omega t \quad y = b \sin \omega t$

$$\therefore \frac{x^2}{a^2} + \frac{y^2}{b^2} = \cos^2 \omega t + \sin^2 \omega t = 1$$

In order to compute the area A_3 under the v -diagram, we must analyze the fictitious motion between 16 s and t_1 (time when the slope of v -diagram becomes zero).

From similar triangles: $\frac{t_1 - 16}{0.75} = \frac{16}{1.75 - 0.75}$

$$\therefore t_1 = 28 \text{ s}$$

$$A_1 = -\frac{1}{2}(1.75 + 0.75)(16) = -20 \text{ m/s}$$

$$A_2 = -\frac{1}{2}(0.75)(28 - 16) = -4.5 \text{ m/s}$$

$$v|_{16\text{s}} = v|_0 + A_1 = v_0 - 20 \text{ m/s}$$

$$\text{But } v|_{16\text{s}} = 0 \quad \therefore v_0 = 20 \text{ m/s} \quad \blacklozenge$$

$$v|_{28\text{s}} = v|_{16\text{s}} + A_2 = 0 - 4.5 = -4.5 \text{ m/s}$$

$$A_3 = \frac{1}{3}(24.5)(28) - (4.5)(28) + \frac{2}{3}(12)(4.5)$$

$$= 138.7 \text{ m (see diagram below)}$$

$$x|_{16\text{s}} = x|_0 + A_3 = 0 + 138.7 = 138.7 \text{ m} \quad \blacklozenge$$

$$A_3 = \frac{24.5}{28} \triangle - 4.5 \square + \frac{12}{4.5} \triangle$$

12.98

$$v = 0 \text{ when } 40 - 9.6 - 25 - 1.8t_1 = 0 \quad \therefore t_1 = 3.0\text{s}$$

After touchdown, the plane travels 203 m ◀

12.99

From the v diagram:

$$v|_{0.4\text{s}} = 1.2 \text{ m/s} \quad \blacktriangleleft$$

$$\begin{aligned} x|_{0.4\text{s}} &= \text{area under } v \text{ diagram} \\ &= 2 \left[\frac{1}{3}(0.6)(0.1) \right] + 4(0.6)(0.1) = 0.28 \text{ m} \quad \blacktriangleleft \end{aligned}$$

12.100

$$\Sigma F_x = ma_x : \rightarrow P(t) - 7.12 = \frac{35.6}{9.81}a$$

$$\therefore a = 0.276 P(t) - 1.962 \text{ m/s}^2$$

Consider only one cycle of acceleration.

$$A_1 = (0.276P_0 - 1.962)(0.2)$$

$$= 0.0552P_0 - 0.3924 \text{ m/s}$$

$$A_2 = -(1.962)(0.3) = -0.589 \text{ m/s}$$

For the average speed to be constant, the change of speed over the cycle must be zero.

$$\therefore \Delta v = A_1 + A_2 = 0$$

$$\therefore 0.0552P_0 - 0.3924 - 0.589 = 0$$

$$\therefore P_0 = 17.8 \text{ N} \blacklozenge$$

$$v|_{0.2s} = v|_0 + A_1 = 0 + 0.589 = 0.589 \text{ m/s}$$

$$A_3 = \frac{1}{2}(0.589)(0.5) = 0.1473 \text{ m}$$

$$x|_{0.5s} = x|_0 + A_3 = 0 + 0.1473 = 0.1473 \text{ m}$$

This is also the distance traveled during the 0.5 second cycle.

$$\therefore v_{\text{aver}} = \frac{\Delta x}{\Delta t} = \frac{0.1473}{0.5} = 0.295 \text{ m/s} \blacklozenge$$

12.101

$$A_1 = A_3 = (5.407)(0.2) = 1.081 \text{ m/s}$$

$$A_2 = -1.962(0.3) = -0.6589 \text{ m/s}$$

$$v|_{0.2s} = v|_0 + A_1 = 0.61 + 1.081 = 1.691 \text{ m/s}$$

$$v|_{0.5s} = v|_{0.2s} + A_2 = 1.691 - 0.589 = 1.102 \text{ m/s}$$

$$v|_{0.7s} = v|_{0.5s} + A_3 = 1.102 + 1.081 = 2.183 \text{ m/s}$$

$$A_4 = \frac{1}{2}(0.61 + 1.691)(0.2) = 0.23 \text{ m}$$

$$A_5 = \frac{1}{2}(1.691 + 1.102)(0.3) = 0.419 \text{ m}$$

$$A_6 = \frac{1}{2}(1.102 + 2.183)(0.2) = 0.329 \text{ m}$$

$$x|_{0.2s} = x|_0 + A_4 = 0 + 0.23 = 0.23 \text{ m}$$

$$x|_{0.5s} = x|_{0.2s} + A_5 = 0.23 + 0.419 = 0.649 \text{ m}$$

$$x|_{0.7s} = x|_{0.5s} + A_6 = 0.649 + 0.329 = 0.978 \text{ m}$$

At $t = 0.7 \text{ s}$:

$$(a)v = 2.18 \text{ m/s} \quad (a)x = 0.98 \text{ m}$$

12.102

From similar triangles on the a -diagram:

$$\frac{t_1}{0.38} = \frac{1.1}{0.78} \quad t_1 = 0.5359 \text{ s}$$

$$v_{\max} = 0.1018 \text{ m/s} \quad \blacktriangleleft \quad y_{\max} = 0.0728 \text{ m} \quad \blacktriangleleft$$

12.103

From similar triangles on a -diagram:

$$\frac{t_1}{18.3} = \frac{14}{18.3 + 9.81} \quad \therefore t_1 = 9.114 \text{ s}$$

Let t_2 be the time when $v = 0$. Therefore,

$$59.3 - 9.81(t_2 - 14) = 0 \quad \therefore t_2 = 20.04 \text{ s}$$

$$v_{\max} = 83.3 \text{ m/s} \quad \blacktriangleleft \quad y_{\max} = 1053 \text{ m} \quad \blacktriangleleft \quad \text{occurring at } t = 20.0 \text{ s} \quad \blacktriangleleft$$

$$v_y = \dot{y} = -gt + v_0 \sin \theta_0 = -9.81(6.162) + 45 \sin 40^\circ = -31.52 \text{ m/s}$$

$$v = \sqrt{34.47^2 + 31.52^2} = 46.7 \text{ m/s} \quad \blacktriangleleft$$

12.122

(a) $\Sigma F = ma$: $+\downarrow \quad mg - kx = ma \quad \therefore a = g - \frac{k}{m}x$

$$a = \frac{dv}{dx}v \quad \therefore \int v \, dv = \int a \, dx$$

$$\therefore \frac{1}{2}v^2 = gx - \frac{k}{2m}x^2 + C$$

Initial condition: $v = 0$ when $x = 0$. $\therefore C = 0$

Spring force is maximized when x is maximized, i.e. when $v = 0$.

$$\therefore gx_{\max} - \frac{k}{2m}x_{\max}^2 = 0 \quad \therefore x_{\max} = \frac{2mg}{k} \quad \therefore F_{\max} = kx_{\max} = 2mg \quad \blacklozenge$$

(b) v is maximized when $a = 0$. $\therefore g - \frac{k}{m}x = 0 \quad \therefore x = \frac{mg}{k}$

$$\therefore \frac{1}{2}v_{\max}^2 = g\left(\frac{mg}{k}\right) - \frac{k}{2m}\left(\frac{mg}{k}\right)^2 = g^2 \frac{m}{2k} \quad \therefore v_{\max} = g\sqrt{m/k} \quad \blacklozenge$$

Chapter 13

Dynamics of a Particle: Curvilinear Coordinates

Introduction

- In many cases, non-rectilinear motion is better described by non-Cartesian coordinates.
- Common non-Cartesian coordinates are path (normal-tangential) coordinates and polar (R - θ) coordinates.
- The kinematics of each of these are significantly different from the rectilinear kinematics.
- The kinetics of these coordinate systems are not significantly different v. rectilinear kinetics.

Kinematics of Path (normal-tangential) Coordinates

- In many cases, non-rectilinear motion is better described by non-Cartesian coordinates.
- Common ones are path coordinates and polar coordinates.
- The kinematics of each of these are significantly different from the rectilinear kinematics.
- The kinetics of these coordinate systems are not significantly different.

Normal-Tangential Geometry

- The particle orbits a center of curvature, C .
- The distance from C to the particle is the radius of curvature, ρ .
 - ρ^{-1} is the *path* curvature.
- A distance of ds is traced out by movement of ρ by $d\theta$ during dt .
 - $\dot{s} = \rho \dot{\theta}$

n-t Geometry (Cont.)

- Base vectors $\mathbf{e}_t$ and $\mathbf{e}_n$ – the unit tangent and unit normal
 - $\mathbf{e}_t$ is tangent to the path
 - $\mathbf{e}_n$ is normal to the path and points toward C.
- $\mathbf{e}_t$ and $\mathbf{e}_n$ change instantaneously with the movement of the particle.
- $\mathbf{e}_t = \frac{d\mathbf{r}}{ds}$

Derivatives of Base Vectors

- $\mathbf{e}_t$ and $\mathbf{e}_n$ change with time, so their derivatives are nonzero.
 - $\dot{\mathbf{e}}_t = \dot{\theta} \mathbf{e}_n$
 - $\dot{\mathbf{e}}_n = -\dot{\theta} \mathbf{e}_t$

Velocity (n-t)

- Velocity is always tangent to the path.
 - $\mathbf{v} = v\mathbf{e}_t$
 - Velocity is equal to a magnitude (v) and a direction (the unit tangent).
- The magnitude of $\mathbf{v}$ is the speed ($\dot{s}$).

Acceleration (n-t)

- Acceleration is composed of both a normal and tangential component:
 - $\mathbf{a} = a_t \mathbf{e}_t + a_n \mathbf{e}_n$
- Tangential acceleration (a_t) is caused by a change in speed.
- Normal acceleration (a_n) is caused by a change in direction of the particle velocity.
 - This is also called centripetal acceleration.

Circular Path Motion (n-t)

- If the path is a circle of radius R , equations simplify:
 - $v = R\dot{\theta}$
 - $a_n = \frac{v^2}{R} = R\dot{\theta}^2$
 - $a_t = \dot{v} = R\ddot{\theta}$
- $\dot{\theta}$ is called the *angular velocity*
- $\ddot{\theta}$ is called the *angular rotation*

(a) Velocity

(c) Acceleration for decreasing speed

(b) Acceleration for increasing speed

(d) Acceleration for constant speed

Space Motion (n-t)

- An osculating plane is formed by the unit tangent and unit, or principal, normal vectors.
- A third vector, the binormal, is perpendicular to these two.
- Path (normal-tangential) coordinates are complex and not common for 3D motion.

Polar Geometry

- A particle position is specified by (R, θ) .
 - Distance from the origin and angle from x -axis
- Base vectors are $\mathbf{e}_R$ and $\mathbf{e}_\theta$.
 - Also change with time, like $\mathbf{e}_t$ and $\mathbf{e}_n$

Derivatives of Base Vectors

- $\mathbf{e}_R$ and $\mathbf{e}_\theta$ change with time, so their derivatives are nonzero.
 - $\dot{\mathbf{e}}_R = \dot{\theta} \mathbf{e}_\theta$
 - $\dot{\mathbf{e}}_\theta = -\dot{\theta} \mathbf{e}_R$

Polar Velocity

- Velocity vector $\mathbf{v}$ is composed of radial and transverse components.
- $\mathbf{v} = v_R \mathbf{e}_R + v_\theta \mathbf{e}_\theta$
 - $v_R = \dot{R}$
 - $v_\theta = R\dot{\theta}$

Polar Acceleration

- Acceleration vector $\mathbf{a}$ is composed of radial and transverse components:
- $\mathbf{a} = a_R \mathbf{e}_R + a_\theta \mathbf{e}_\theta$
 - $a_R = \ddot{R} - R\dot{\theta}^2$
 - $a_\theta = R\ddot{\theta} + 2\dot{R}\dot{\theta}$
- $\ddot{\theta}$ is the *angular acceleration*.
- If R is constant, $\mathbf{a} = -R\dot{\theta}^2 \mathbf{e}_R + R\ddot{\theta} \mathbf{e}_\theta$

Space Motion

- In three-dimensions, polar coordinates become cylindrical coordinates.
- A third base vector is $\mathbf{e}_z$, the axial coordinate.
 - $\mathbf{e}_z = \mathbf{k}$
- 3D equations for position, velocity and acceleration are their 2D equations with the $z\mathbf{e}_z$, $\dot{z}\mathbf{e}_z$, $\ddot{z}\mathbf{e}_z$ terms added.

Force-Mass-Acceleration Method

- Step 1: Draw the FBD.
- Step 2: Determine the acceleration of the particle.
- Step 3: Draw the MAD (acceleration found in step 2).
- Step 4: Set the sum of the forces from the FBD equal to the mass-acceleration from the MAD. Solve for the unknown.

Kinematics of FMA Method

- For path (n-t) coordinates, $\sum F_t = ma_t$ and $\sum F_n = ma_n$.
- For cylindrical coordinates, $\sum F_R = ma_R$, $\sum F_\theta = ma_\theta$ and $\sum F_z = ma_z$.
- Steps 3 and 4 of the FMA method are the same as for before.
