## **Chapter 2: Research Design**

SI = section introduction

- 1. Research methodology is the science of methods for investigating phenomena (SI). Ans: T
- The purpose of applied research is to develop new knowledge about phenomena such as problems, events, programs, or policies, and their relationships (SI). Ans: F
- 3. Research begins by asking questions (SI). Ans: T
- 4. Quantitative research methods involve the collection of data that can be analyzed using statistical methods (SI).
  - Ans: T
- Both quantitative and qualitative methods are indispensable in addressing questions of basic and applied research (SI). Ans: T
- 6. Research is fundamentally about establishing the nature of things. Ans: T
- 7. Variables are defined as empirically observable phenomena that vary. Ans: T
- 8. Attributes are defined as observable phenomena that do not vary. Ans: F
- 9. Descriptive analysis provides information about the nature of variables. Ans: T
- Relationships involve specifying which variables are related to each other, and the ways in which they are related to each other. Ans: T
- 11. Relationships in social science are usually deterministic in nature. Ans: F
- 12. A single exception will normally disprove claims about relations in social science. Ans: F
- 13. Relationships also are distinguished as being either causal or associational. Ans: T
- 14. Distinguishing between independent and dependent variables is a cornerstone of research. Ans: T
- 15. Causation requires both (1) empirical (i.e., statistical) correlation and (2) a plausible cause-and-effect argument.
  - Ans: T
- 16. A theory exists for just about every relationship in social science. Ans: F
- 17. Program evaluation involves three steps. Ans: F
- Control variables are always dependent variables. Ans: F
- 19. Rival hypotheses are plausible counter explanations for relationships that are found. Ans: T

- Classic experimental designs are widely used in public management and policy for determining the effect of new policies and programs. Ans: F
- 21. Statistics is the only way for dealing with rival hypotheses. Ans: F
- If X causes Y (or in notation, X → Y), then X is called the dependent variable because it affects Y.
  Ans: F
- 23. Threats to external validity are defined as those that jeopardize the generalizability of study conclusions about program outcomes to other situations. Ans: T
- 24. Threats to internal validity are those that jeopardize the study conclusions about whether an intervention in fact caused a difference in the study population. Ans: T
