60. Discuss how the order of precedence works in the formula  $=25+2/3$  and  $=(25+2)/3$ . Describe the order of calculations in your answer.

**ANSWER:** The order of precedence in Excel is that operations in parentheses are calculated first, then exponents, then multiplication and division, then addition and subtraction. Multiplication and division are calculated left to right, as are addition and subtraction. In the formula  $=25+2/3$ , 2 is divided by 3 first, then that value is added to 25. In the formula  $=(25+2)/3$ , 25 is added to 2 first, because it is in parentheses, then that value is divided by 3. The formulas will have two different results.

62. Discuss the difference between a relative cell reference and an absolute cell reference. Include the following information in your answer: how the two types of cell addresses are designated, what happens when each type of cell reference is copied, and when it is appropriate to use each type of reference.

**ANSWER:** A relative cell reference is used when the relationship to the formula must be preserved; it is the most commonly used type of cell reference in Excel. An absolute cell reference is used when the exact cell reference must be maintained in all formulas referencing the cell address. Absolute cell references do not change even if formulas are copied to other locations. Relative cell addresses change when copied to reflect the appropriate column and row where the formula is being copied. The \$ symbol placed before a column letter or row number in a cell address makes that portion of the cell reference absolute. It is appropriate to use an absolute cell reference (or mixed cell reference) when the value of a column, row, or cell address MUST be used in a formula. All other times, relative cell references may be used.

63. Explain the use of the fill handle to fill cells with sequential information.

**ANSWER:** Often, you need to fill cells with sequential text: months of the year, days of the week, years, or text plus a number (Quarter 1, Quarter 2,...). For example, you might want to create a worksheet that calculates data for every month of the year. Using the fill handle, you can quickly and easily create labels for the months of the year just by typing "January" in a cell. Drag the fill handle from the cell containing "January" until you have all the monthly labels you need. You can also easily fill cells with a date sequence by dragging the fill handle on a single cell containing a date. You can fill cells with a number sequence (such as 1, 2, 3,...) by dragging the fill handle on a selection of two or more cells that contain the sequence. To create a number sequence using the value in a single cell, press and hold [Ctrl] as you drag the fill handle of the cell. As you drag the fill handle, Excel automatically extends the

existing sequence into the additional cells. (The content of the last filled cell appears in the ScreenTip.) To examine all the fill series options for the current selection, click the Fill button in the Editing group on the HOME tab, then click Series to open the Series dialog box.

64. Discuss the use of an Excel template to create a workbook.

**ANSWER:** Excel templates are predesigned workbook files intended to save time when you create common documents such as balance sheets, budgets, or time cards. Templates contain labels, values, formulas, and formatting, so all you have to do is customize them with your own information. Excel comes with many templates, and you can also create your own or find additional templates on the Web. Unlike a typical workbook, which has the file extension .xlsx, a template has the extension .xltx. To create a workbook using a template, click the File tab, then click New on the navigation bar. The New pane in Backstage view lists templates available through Office.com. The Blank workbook template is selected by default and is used to create a blank workbook with no content or special formatting. A preview of the selected template appears in a separate window on top of the New pane. To select a template, click one of the selections in the New pane, then click Create. When you click Create, a new workbook is created based on the template; when you save the new file in the default format, it has the regular .xlsx extension. To save a workbook of your own as a template, open the Save As dialog box, click the Save as type list arrow, then change the file type to Excel Template.
