

Chapter 2

$$2.1 \quad C_u = \frac{D_{60}}{D_{10}} = \frac{0.48}{0.11} = \mathbf{4.36}; \quad C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{0.25^2}{(0.48)(0.11)} = \mathbf{1.18}$$

Since $C_u > 4$ and C_c is between 1 and 3, the soil is **well graded**.

$$2.2 \quad C_u = \frac{D_{60}}{D_{10}} = \frac{1.1}{0.18} = \mathbf{6.11}; \quad C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{0.41^2}{(1.1)(0.18)} = 0.727 \approx \mathbf{0.73}$$

Although $C_u > 6$, C_c is not between 1 and 3. The soil is **poorly graded**.

- 2.3 The D_{10} , D_{30} , and D_{60} for soils A , B , and C are obtained from the grain-size distribution curves.

$$\text{Soil A: } C_u = \frac{D_{60}}{D_{10}} = \frac{3.5}{0.2} = \mathbf{17.5}; \quad C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{1.95^2}{(3.5)(0.2)} = \mathbf{5.43}$$

Although $C_u > 6$, C_c is not between 1 and 3. The sand is **poorly graded**.

$$\text{Soil B: } C_u = \frac{D_{60}}{D_{10}} = \frac{1.5}{0.17} = \mathbf{8.82}; \quad C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{0.75^2}{(1.5)(0.17)} = \mathbf{2.2}$$

$C_u > 6$ and C_c is between 1 and 3. The sand is **well graded**.

$$\text{Soil C: } C_u = \frac{D_{60}}{D_{10}} = \frac{0.55}{0.032} = \mathbf{17.2}; \quad C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{0.22^2}{(0.55)(0.032)} = \mathbf{2.75}$$

$C_u > 6$ and C_c is between 1 and 3. The sand is **well graded**.

2.4 a.

Sieve No.	Mass of soil retained on each sieve (g)	Percent retained on each sieve	Percent finer

2.14 $G_s = 2.65$; temperature = 26°C ; time = 45 min.; $L = 10.4$ cm.

$$\text{Eq. (2.6): } D(\text{mm}) = K \sqrt{\frac{L(\text{cm})}{t(\text{min})}}$$

From Table 2.9 for $G_s = 2.65$ and temperature = 26°C, $K = 0.01272$

$$D = 0.01272 \sqrt{\frac{10.4}{45}} = \mathbf{0.006 \text{ mm}}$$

2.15 $G_s = 2.75$; temperature = 21°C; time = 88 min.; $L = 11.7 \text{ cm}$

$$\text{Eq. (2.6): } D (\text{mm}) = K \sqrt{\frac{L (\text{cm})}{t (\text{min})}}$$

From Table 2.6 for $G_s = 2.75$ and temperature = 21°C, $K = 0.01309$

$$D = 0.01309 \sqrt{\frac{11.7}{88}} = \mathbf{0.0047 \text{ mm}}$$

CRITICAL THINKING PROBLEMS

2.C.1 a. Soil A: $C_u = \frac{D_{60}}{D_{10}} = \frac{11}{0.6} = \mathbf{18.33}$; $C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{5^2}{(11)(0.6)} = \mathbf{3.78}$

Soil B: $C_u = \frac{D_{60}}{D_{10}} = \frac{7}{0.2} = \mathbf{35}$; $C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{2.1^2}{(7)(0.2)} = \mathbf{3.15}$

Soil C: $C_u = \frac{D_{60}}{D_{10}} = \frac{4.5}{0.15} = \mathbf{30}$; $C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{1^2}{(4.5)(0.15)} = \mathbf{1.48}$

- b. Soil A is coarser than Soil C. A higher percentage of soil C is finer than any given size compared to Soil A. For example, about 15% is finer than 1 mm for Soil A, whereas almost 30% is finer than 1 mm for Soil C.
- c. Particle segregation may take place in aggregate stockpiles such that there is a separation of coarser and finer particles. This makes representative sampling difficult. Therefore, Soils A, B, and C demonstrate quite different particle size distribution.

d. Soil A

Percent passing 4.75 mm = 29 GRAVEL: $100 - 29 = 71\%$
 Percent passing 0.075 mm = 1 SAND: $29 - 1 = 28\%$
 FINES: $1 - 0 = 1\%$

Soil B

Percent passing 4.75 mm = 45 GRAVEL: $100 - 45 = 55\%$
 Percent passing 0.075 mm = 2 SAND: $45 - 2 = 43\%$
 FINES: $2 - 0 = 2\%$

Soil C

Percent passing 4.75 mm = 53 GRAVEL: $100 - 53 = 47\%$
 Percent passing 0.075 mm = 3 SAND: $53 - 3 = 50\%$
 FINES: $3 - 0 = 3\%$

2.C.2 a. Total mass in the ternary mix = $8000 \times 3 = 24,000$ kg

$$\text{Percent of each soil in the mix} = \frac{8,000}{24,000} \times 100 = 33.33\%$$

Mass of each soil used in the sieve analysis, $\Sigma m_A = \Sigma m_B = \Sigma m_C = 500$ g

If a sieve analysis is conducted on the ternary mix using the same set of sieves, the percent of mass retained on each sieve, $m_M(\%)$, can be computed as follows:

$$m_M(\%) = 0.333 \left(\frac{m_A}{500} \times 100 \right) + 0.333 \left(\frac{m_B}{500} \times 100 \right) + 0.333 \left(\frac{m_C}{500} \times 100 \right)$$

The calculated values are shown in the following table.

Sieve size (mm)	Mass retained			m_M (%)	Percent passing for the mixture
	m_A (g)	m_B (g)	m_C (g)		
25.0	0.0	0	0	0.0	100
19.0	60	10	30	6.66	93.34
12.7	130	75	75	18.65	74.69
9.5	65	80	45	12.65	62.04
4.75	100	165	90	23.64	38.4
2.36	50	25	65	9.32	29.08
0.6	40	60	75	11.65	17.43
0.075	50	70	105	14.98	2.45
Pan	5	15	15	2.33	≈ 0

- b. The grain-size distribution curve for the mixture is drawn below.

From the curve, $D_{10} = 0.21$; $D_{30} = 2.5$; $D_{60} = 9.0$

$$C_u = \frac{D_{60}}{D_{10}} = \frac{9.0}{0.21} = 42.85; \quad C_c = \frac{D_{30}^2}{(D_{60})(D_{10})} = \frac{2.5^2}{(9.0)(0.21)} = 3.31$$
