

**Chapter 3 Multiple-Choice Items**

---

**MULTIPLE CHOICE**

1. The cells of the nervous system that do the work of receiving, integrating, and transmitting information are the
- neurilemma.
  - glia.
  - neuroblasts.
  - neurons.

ANS: D                      PTS: 1                      DIF: Correct = 94%  
REF: Communication in the Nervous System                      OBJ: 3.1  
KEY: Factual

2. Which of the following is NOT one of the main functions of neurons?
- receiving information
  - generating information
  - transmitting information
  - integrating information

ANS: B                      PTS: 1                      DIF: Correct = 82%  
REF: Communication in the Nervous System                      OBJ: 3.1  
KEY: Concept/Applied

3. Emma has multiple sclerosis. If you could view her nervous system, you would find
- a lack of neurotransmitters in some neurons.
  - areas where the myelin sheath has degenerated.
  - areas where the dendrites are severely damaged.
  - a reduction in the number of chloride ions in her peripheral nervous system.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.1                      KEY: Concept/Applied

4. In computers, when the print command is executed, a cable carries this signal from the computer to the printer. In comparing a computer to a neuron, the cable that carries the signal between the computer and the printer would be equivalent to
- a refractory potential.
  - the axon.
  - the dendrites.
  - the soma.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.1                      KEY: Critical Thinking

5. The correct order that information passes through in a neuron is
- dendrite, soma, axon.
  - axon, soma, dendrite.
  - dendrite, axon, soma.
  - axon, dendrite, soma.

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.1                      KEY: Factual

6. The main function of dendrites is to
- support and insulate the neuron.
  - release neurotransmitters.
  - transmit information.
  - receive information.

ANS: D  
OBJ: 3.1

PTS: 1  
TOP: WWW

REF: Communication in the Nervous System  
KEY: Factual

7. Information is received by a neuron through the \_\_\_\_ and is transmitted toward other neurons through the \_\_\_\_.
- dendrites; soma
  - dendrites; axon
  - axon; dendrites
  - soma; axon

ANS: B  
OBJ: 3.1

PTS: 1  
KEY: Factual

REF: Communication in the Nervous System

8. The part of a neuron that transmits information away from the neuron and toward another neuron is the
- synapse.
  - soma.
  - dendrites.
  - axon.

ANS: D  
OBJ: 3.1

PTS: 1  
KEY: Factual

REF: Communication in the Nervous System

9. The insulation that covers some axons and increases the speed of transmission of the neural impulse is the
- neurotransmitter sheath.
  - myelin sheath.
  - glia wrap.
  - terminal cover.

ANS: B  
OBJ: 3.1

PTS: 1  
KEY: Factual

REF: Communication in the Nervous System

10. Terminal buttons are located
- in the synaptic cleft.
  - on the soma.
  - at the end of dendrites.
  - at the end of axons.

ANS: D  
OBJ: 3.1

PTS: 1  
KEY: Factual

REF: Communication in the Nervous System

11. The chemicals that are secreted from the terminal buttons into the synapse are
- neurotransmitters.
  - action potentials.
  - antagonists.
  - agonists.

ANS: A

PTS: 1

REF: Communication in the Nervous System

OBJ: 3.1 KEY: Factual

12. The cells that provide nourishment and insulation for neurons are called
- glia.
  - somata.
  - neuromodulators.
  - dendrites.

ANS: A PTS: 1 DIF: Correct = 80%  
REF: Communication in the Nervous System OBJ: 3.1  
KEY: Factual

13. Cells found in the nervous system that insulate, nourish, and direct the growth of neurons as well as remove dead neurons and waste products are known as
- neurotransmitters.
  - myelin sheaths.
  - glia.
  - synapses.

ANS: C PTS: 1 REF: Communication in the Nervous System  
OBJ: 3.1 KEY: Factual

14. The difference in the flow rates of sodium and potassium ions across the cell membrane leads to
- a slightly higher concentration of negatively charged ions inside the cell.
  - a negatively charged action potential.
  - a slightly lower concentration of negatively charged ions inside the cell.
  - both a negatively charged action potential and a slightly lower concentration of negatively charged ions inside the cell.

ANS: A PTS: 1 REF: Communication in the Nervous System  
OBJ: 3.2 KEY: Critical Thinking

15. The tiny electrical charge that exists when a neuron is NOT receiving or sending information is called
- an action potential.
  - a synaptic gap.
  - a resting potential.
  - a postsynaptic potential.

ANS: C PTS: 1 REF: Communication in the Nervous System  
OBJ: 3.2 KEY: Factual

16. The electrical charge that exists between the inside and the outside of a neuron when the neuron is neither receiving nor sending is approximately
- 1,000 millivolts.
  - +60 to +70 millivolts.
  - 60 to -70 millivolts.
  - +1,000 millivolts.

ANS: C PTS: 1 REF: Communication in the Nervous System  
OBJ: 3.2 KEY: Factual

17. Bradley is deeply relaxed and his muscles are not moving at all. This suggests that, for Bradley's motor neurons,
- a. sodium ions are concentrated inside the neurons and potassium ions are concentrated outside the neurons.
  - b. sodium ions and potassium ions are both concentrated inside the neurons.
  - c. sodium ions and potassium ions are both concentrated outside the neurons.
  - d. sodium ions are concentrated outside the neurons and potassium ions are concentrated inside the neurons.

ANS: D                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Concept/Applied

18. Neurotransmitters are secreted from the
- a. myelin sheath.
  - b. terminal buttons.
  - c. neuromodulators.
  - d. dendrites.

ANS: B                      PTS: 1                      DIF: Correct = 60%  
REF: Communication in the Nervous System                      OBJ: 3.1  
TOP: WWW                      KEY: Factual

19. An action potential is
- a. the tiny electrical charge that exists when a neuron is neither receiving nor sending information.
  - b. an electrical signal that travels along the axon of a neuron.
  - c. the small gap that exists between adjacent neurons.
  - d. an electrical signal that travels along the dendrites of a neuron.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

20. Leonard's mother became dehydrated during a recent illness, and the levels of sodium in her body were significantly reduced. If enough sodium was lost, you might expect that
- a. her nervous system would become highly activated and action potentials would be generated continuously.
  - b. fewer action potentials would occur in her nervous system.
  - c. more neurotransmitters would be produced in her terminal buttons.
  - d. glial cells would start to degenerate and die.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Critical Thinking

21. The minimum length of time between action potentials is determined by
- a. transduction capacity.
  - b. transduction incapacity.
  - c. the absolute refractory period.
  - d. the relative threshold period.

ANS: C                      PTS: 1                      DIF: Correct = 81%  
REF: Communication in the Nervous System                      OBJ: 3.2  
KEY: Factual

22. The neurons in Michael's arm just sent a neural impulse. It will be 1–2 milliseconds before another neural impulse can be generated. This brief time period, when another neural impulse cannot occur, is called the
- all-or-none period.
  - absolute refractory period.
  - resting potential.
  - postsynaptic discharge.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Concept/Applied

23. Sara is holding Scott's hand during a scary movie. Suddenly, she squeezes his hand very hard. When she does this, the neurons in Scott's hand will
- start to fire at a faster rate.
  - send stronger signals to his central nervous system.
  - enter an absolute refractory period.
  - release more chloride ions.

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Critical Thinking

24. Fiona puts her hands into a sinkful of lukewarm water; Luke puts his hands into a sinkful of ice-cold water. Based on what is known about neural transmission, you could predict that the action potentials will
- travel more quickly in Luke's system because the stimulus is more intense.
  - be weaker in Fiona's system because the stimulus is less intense.
  - be the same in both individuals due to the all-or-none principle.
  - travel a shorter distance in Luke's system because the stimulus is more intense.

ANS: C                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Critical Thinking

25. Peggy smells a very strong odor; Harry smells an odor that is barely detectable. Based on what is known about neural transmission, you could predict that the action potentials will
- travel more quickly in Peggy's system because the stimulus is more intense.
  - be weaker in Harry's system because the stimulus is less intense.
  - travel a shorter distance in Peggy's system because the stimulus is more intense.
  - be the same in both individuals due to the all-or-none principle.

ANS: D                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Critical Thinking

26. As a neuron is stimulated and starts to receive information, the neuron's electrical charge
- becomes less negative.
  - becomes more negative.
  - immediately becomes positive.
  - immediately affects the next neuron.

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      TOP: WWW                      KEY: Factual

27. When a neuron is firing its action potential, the neuron's electrical charge is
- negative and travels along the axon.
  - negative and travels along the dendrite.
  - positive and travels along the axon.
  - positive and travels along the dendrite.

ANS: C                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

28. According to the \_\_\_\_ law, a neuron fires an action potential at only one level of intensity.
- all-or-none
  - threshold
  - refractory
  - action

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

29. An impulse moves from one neuron to another through the action of
- neurotransmitters.
  - hormones.
  - action potentials.
  - neuromodulators.

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

30. Synaptic vesicles are structures that
- control the speed with which a neuron fires.
  - manufacture myelin.
  - store neurotransmitters.
  - provide energy for a neuron's activity.

ANS: C                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

31. The microscopic gap between the terminal buttons of one neuron and the cell membrane of another neuron is the
- neurotransmitter cleft.
  - synaptic cleft.
  - presynaptic space.
  - postsynaptic space.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

32. What event causes the release of neurotransmitters into the synaptic cleft?
- The arrival of the action potential at the postsynaptic neuron.
  - The arrival of the resting potential at the postsynaptic neuron.
  - The arrival of the action potential at the terminal buttons.
  - The arrival of the resting potential at the terminal buttons.

ANS: C                      PTS: 1                      REF: Communication in the Nervous System

OBJ: 3.2                      KEY: Factual

33. An electric potential that increases the likelihood that the postsynaptic neuron will fire is called an
- all-or-none potential.
  - inhibitory postsynaptic potential.
  - excitatory postsynaptic potential.
  - excitatory presynaptic potential.

ANS: C                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

34. Reabsorption of neurotransmitters into the presynaptic neuron is referred to as
- cyclomyosis.
  - regrading.
  - uploading.
  - reuptake.

ANS: D                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

35. The elimination of old, less active synapses is known as
- synaptic reuptake.
  - synaptic pruning.
  - neurogenesis.
  - synaptic sculpting.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

36. A postsynaptic potential occurs when
- neurotransmitters are released into the synaptic cleft.
  - neurotransmitters are reabsorbed into the terminal buttons.
  - neurotransmitters bind or attach to receptor sites on the postsynaptic neuron.
  - neurotransmitters bind or attach to receptor sites on the presynaptic neuron.

ANS: C                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Factual

37. If inhibitory postsynaptic potentials did not exist,
- it would be “easier” for a neuron to fire its action potential.
  - it would be “harder” for a neuron to fire its action potential.
  - there would not be any effect on the ease at which a neuron fires its action potential.
  - it would be impossible for neural impulses to travel across the synapse.

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.2                      KEY: Critical Thinking

38. Jeremy is sitting quietly when the muscles in his left leg begin to “twitch.” This activation of movement in his voluntary muscles is most likely due to the release of the neurotransmitter
- serotonin.
  - dopamine.
  - acetylcholine.
  - norepinephrine.

ANS: C                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Critical Thinking

39. Dr. Jacoby has just discovered a new drug that blocks the action of acetylcholine. It is likely that this new drug will produce side effects such as
- general stimulation within the body and an increase in heart rate.
  - paralysis and memory loss.
  - anxiety reduction and general relaxation.
  - hallucinations and disrupted sleep patterns.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Concept/Applied

40. In Parkinsonism, the tremors, muscular rigidity, and reduced control over voluntary movements appears to be a function of
- damage to glia cells.
  - degeneration of neurons that use dopamine as a neurotransmitter.
  - agonistic chemical action on the receptor sites of the cerebrum.
  - enzymatic deficiency that does not allow for the proper cleanup of waste products in the nervous system.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Concept/Applied

41. Dr. Seelig has just discovered a new drug that produces schizophrenic-like side effects. Based on this information, Dr. Seelig's drug may be acting on which neurotransmitter?
- dopamine
  - GABA
  - serotonin
  - endorphins

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Concept/Applied

42. Kesha has just begun taking a new drug that produces side effects like muscular rigidity and tremors. Based on this information, Kesha's drug may be acting on her \_\_\_\_\_ system.
- dopamine
  - GABA
  - endorphin
  - episodic

ANS: D                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Concept/Applied

43. Abnormalities at norepinephrine and serotonin synapses appear to play a role in which of the following?
- hyperactivity
  - depression
  - high anxiety
  - increased appetite

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Factual

44. Some theorists believe that the rewarding effects of most abused drugs depend on
- decreased activity in specific dopamine pathways.
  - decreased activity in specific glutamate pathways.
  - increased activity in specific glutamate pathways.
  - increased activity in specific dopamine pathways.

ANS: D                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Factual

45. The neurotransmitter(s) released by motor neurons that results in movement of the voluntary muscles is(are)
- endorphins.
  - monoamines.
  - acetylcholine.
  - dopamine.

ANS: C                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Factual

46. People sometimes report a feeling of euphoria following a period of vigorous exercise. This is MOST likely due to the effects of
- endorphins.
  - dopamine.
  - acetylcholine.
  - norepinephrine.

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      TOP: Concept/Applied

47. Which of the following neurotransmitters is NOT a monoamine?
- norepinephrine
  - serotonin
  - dopamine
  - acetylcholine

ANS: D                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Factual

48. Monoamines have been associated with all of the following EXCEPT
- aggressive behavior.
  - pain reduction.
  - schizophrenia.
  - depression.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Critical Thinking

49. The neurotransmitter believed to be associated with schizophrenia is
- dopamine.
  - acetylcholine.

- c. endorphin.
- d. serotonin.

ANS: A                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      TOP: WWW                      KEY: Factual

50. Dr. Athorp has just discovered a new drug that mimics the effects of GABA. It is likely that this new drug will produce side effects such as
- a. general stimulation within the body and an increase in heart rate.
  - b. anxiety reduction and general relaxation.
  - c. a reduction in pain and a sense of euphoria.
  - d. hallucinations and disrupted sleep patterns.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Critical Thinking

51. Opiate drugs bind onto the same receptor sites as the body's own endorphins. Therefore, opiate drugs tend to
- a. reduce anxiety.
  - b. produce sleepiness.
  - c. increase anxiety and agitation.
  - d. relieve pain.

ANS: D                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Concept/Applied

52. Chemicals produced in the body that resemble opiates are
- a. endorphins.
  - b. dopamines.
  - c. biogenic amines.
  - d. acetylcholines.

ANS: A                      PTS: 1                      DIF: Correct = 77%  
REF: Communication in the Nervous System                      OBJ: 3.3  
KEY: Factual

53. Research suggests that the body's endogenous opioids may contribute to all of the following EXCEPT
- a. the modulation of eating behavior.
  - b. the regulation of sleep.
  - c. the body's response to stress.
  - d. the modulation of pain.

ANS: B                      PTS: 1                      REF: Communication in the Nervous System  
OBJ: 3.3                      KEY: Factual

54. The two most basic divisions of the nervous system are the
- a. sympathetic division and the parasympathetic division.
  - b. central nervous system and the peripheral nervous system.
  - c. somatic nervous system and the autonomic nervous system.
  - d. brain and the spinal cord.

ANS: B                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Factual

55. Nerves outside the skull and spine comprise the

- a. peripheral nervous system.
- b. vascular nervous system.
- c. vagus nervous system.
- d. skeletal nervous system.

ANS: A                      PTS: 1                      DIF: Correct = 76%  
REF: Organization of the Nervous System                      OBJ: 3.4  
KEY: Factual

56. The somatic nervous system and the autonomic nervous system comprise the

- a. central nervous system.
- b. peripheral nervous system.
- c. skeletal nervous system.
- d. afferent nervous system.

ANS: B                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Factual

57. Sensory information is carried from your eyes to your brain by way of

- a. afferent fibers.
- b. autonomic fibers.
- c. efferent fibers.
- d. motor fibers.

ANS: A                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Factual

58. \_\_\_\_ nerves receive information, while \_\_\_\_ nerves carry out instructions.

- a. Afferent; efferent
- b. Motor; sensory
- c. Somatic; autonomic
- d. Autonomic; skeletal

ANS: A                      PTS: 1                      DIF: Correct = 50%  
REF: Organization of the Nervous System                      OBJ: 3.4  
KEY: Factual

59. When you are walking, the brain sends messages to the skeletal muscles in the legs by way of

- a. efferent fibers.
- b. sensory fibers.
- c. afferent fibers.
- d. central fibers.

ANS: A                      PTS: 1                      DIF: Correct = 32%  
REF: Organization of the Nervous System                      OBJ: 3.4  
KEY: Concept/Applied

60. The movement of voluntary skeletal muscles involved in doing calisthenics is under the control of the
- somatic nervous system.
  - parasympathetic nervous system.
  - sympathetic nervous system.
  - autonomic nervous system.

ANS: A                      PTS: 1                      DIF: Correct = 63%  
REF: Organization of the Nervous System                      OBJ: 3.4  
KEY: Concept/Applied

61. The part of the nervous system that controls digestion and blood flow is the
- somatic nervous system.
  - motor nervous system.
  - sensory nervous system.
  - autonomic nervous system.

ANS: D                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Factual

62. The \_\_\_\_ nervous system mobilizes the body when one needs to exert tremendous energy (such as flee from an attacker).
- somatic
  - central
  - sympathetic
  - parasympathetic

ANS: C                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Factual

63. Sam is highly relaxed. His blood pressure and heart rate are lower than usual. This relaxation response was most likely the result of activity in his
- somatic nervous system.
  - sympathetic nervous system.
  - parasympathetic nervous system.
  - central nervous system.

ANS: C                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Concept/Applied

64. Edmund was walking down a dark street when he heard a car backfire. His heart started to race and he began to perspire in response to this sudden, startling noise. These physical reactions were triggered by Edmund's
- parasympathetic nervous system.
  - somatic nervous system.
  - sympathetic nervous system.
  - cerebellum.

ANS: C                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Concept/Applied

65. The \_\_\_\_ is most likely to be in control of bodily processes during periods of rest and recovery for the body.
- a. somatic nervous system
  - b. sympathetic nervous system
  - c. parasympathetic nervous system
  - d. hypothalamus

ANS: C                      PTS: 1                      DIF: Correct = 67%  
REF: Organization of the Nervous System                      OBJ: 3.4  
KEY: Factual

66. Which of the following individuals is likely to be at the HIGHEST level of sympathetic arousal?
- a. Melissa, who is daydreaming and staring out the window
  - b. Keith, who is concentrating on a lecturer and taking careful notes
  - c. Professor Trong, who is lecturing
  - d. Bill, who is anticipating an exam he will take within the hour and for which he is unprepared

ANS: D                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Concept/Applied

67. Handyman Bob just hit his thumb with a hammer; the sensation will be transmitted to the central nervous system by \_\_\_\_ nerve fibers.
- a. afferent
  - b. efferent
  - c. autonomic
  - d. sympathetic

ANS: A                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Concept/Applied

68. Efferent nerve fibers transmit messages \_\_\_\_ the brain and spinal cord.
- a. within or between
  - b. away from
  - c. toward
  - d. away from and toward

ANS: B                      PTS: 1                      REF: Organization of the Nervous System  
OBJ: 3.4                      KEY: Concept/Applied

69. The heart, glands, and smooth muscles are controlled by the
- a. peripheral nervous system.
  - b. somatic nervous system.
  - c. efferent nervous system.
  - d. autonomic nervous system.

ANS: D                      PTS: 1                      REF: Organization of the Nervous System

70. The “fight or flight” response is a direct result of activation of the
- a. afferent nervous system.
  - b. efferent nervous system.
  - c. sympathetic nervous system.
  - d. parasympathetic nervous system.

ANS: C

PTS: 1

REF: Organization of the Nervous System

OBJ: 3.4

TOP: WWW

KEY: Factual

71. While the \_\_\_\_ nervous system is associated with conserving bodily resources, the \_\_\_\_ nervous system mobilizes the body’s resources for emergencies.
- a. parasympathetic; sympathetic
  - b. sympathetic; parasympathetic
  - c. peripheral; central
  - d. central; peripheral

ANS: A

PTS: 1

REF: Organization of the Nervous System

OBJ: 3.4

KEY: Factual

72. The central nervous system consists of
- a. the body’s sensory and motor neurons.
  - b. the brain and the spinal cord.
  - c. the somatic and autonomic nervous systems.
  - d. the sympathetic and parasympathetic nervous systems.

ANS: B

PTS: 1

REF: Organization of the Nervous System

OBJ: 3.4

KEY: Factual

73. The \_\_\_\_ fluid nourishes the brain and provides a protective cushion for it.
- a. amniotic
  - b. cerebrospinal
  - c. parasympathetic
  - d. somatic

ANS: B

PTS: 1
