130 Chapter 3: Numerical Descriptive Measures

CHAPTER 3

3.1 (a) Excel output:

X		
Mean	6	
Median	7	
Mode	#N/A	
Standard Deviation	2.915476	
Sample Variance	8.5	
Range	7	
Minimum	2	
Maximum	9	
Sum	30	
Count	5	
First Quartile	3	
Third Quartile	8.5	
Interquartile Range	5.5	
Coefficient of Variation	48.5913%	

Mean = 6 Median = 7 There is no mode.

(b) Range = 7 Variance = 8.5

Standard deviation = 2.9 Coefficient of variation = $(2.915/6) \cdot 100\% = 48.6\%$

- (c) Z scores: 0.343, -0.686, 1.029, 0.686, -1.372 None of the Z scores is larger than 3.0 or smaller than -3.0. There is no outlier.
- (d) Since the mean is less than the median, the distribution is left-skewed.

3.2 (a) Excel output:

X	
Mean	7
Median	7
Mode	7
Standard Deviation	3.286335
Sample Variance	10.8
Range	9
Minimum	3
Maximum	12
Sum	42
Count	6
First Quartile	4
Third Quartile	9
Interquartile Range	5
Coefficient of Variation	46.9476%

Mean = 7 Median = 7 Mode = 7

(b) Range = 9 Variance = 10.8

Standard deviation = 3.286

Coefficient of variation = $(3.286/7) \cdot 100\% = 46.948\%$

- 3.2 (c) Z scores: 0, -0.913, 0.609, 0, -1.217, 1.522 None of the Z scores is larger than 3.0 or smaller than -3.0. There is no outlier. cont.
 - Since the mean equals the median, the distribution is symmetrical. (d)
- 3.3 (a) Excel output:

X	
Mean	6
Median	7
Mode	7
Standard Deviation	4
Sample Variance	16
Kurtosis	-0.34688
Minimum	0
Maximum	12
Sum	42
Count	7
First Quartile	3
Third Quartile	9
Interquartile Range	6
Coefficient of Variation	66.6667%

- Mean = 6Median = 7Mode = 7
- Range = 12Variance = 16 Standard deviation = 4 (b) Coefficient of variation = $(4/6) \cdot 100\% = 66.67\%$
- Z scores: 1.5, 0.25, -0.5, 0.75, -1.5, 0.25, -0.75. There is no outlier. (c)
- Since the mean is less than the median, the distribution is left-skewed. (d)
- 3.4 Excel output:

X	
Mean	2
Median	7
Mode	7
Standard Deviation	7.874007874
Sample Variance	62
Range	17
Minimum	-8
Maximum	9
Sum	10
Count	5
First Quartile	-6.5
Third Quartile	8
Interquartile Range	14.5
Coefficient of Variation	393.7004%

(a) Mean = 2Median = 7Mode = 7

- 3.4 (b) Range = 17 Variance = 62 cont. Standard deviation = 7.874 Coefficient of variation = $(7.874/2) \cdot 100\% = 393.7\%$
 - (c) Z scores: 0.635, -0.889, -1.270, 0.635, 0.889. No outliers.
 - (d) Since the mean is less than the median, the distribution is left-skewed.

3.5
$$\overline{R}_G = [(1+0.1)(1+0.3)]^{1/2} - 1 = 19.58\%$$

3.6
$$\overline{R}_G = \left[(1+0.2)(1-0.3) \right]^{1/2} - 1 = -8.348\%$$

3.7 Half of the associate professors make no more than \$90,200 while half of the full professors make no more than \$112,000 a year.

3.8	(a)		Grade X	Grade Y
		Mean	575	575.4
		Median	575	575
		Standard deviation	6.4	2.1

(b) If quality is measured by central tendency, Grade *X* tires provide slightly better quality because *X*'s mean and median are both equal to the expected value, 575 mm. If, however, quality is measured by consistency, Grade *Y* provides better quality because, even though *Y*'s mean is only slightly larger than the mean for Grade *X*, *Y*'s standard deviation is much smaller. The range in values for Grade *Y* is 5 mm compared to the range in values for Grade *X*, which is 16 mm.

(c) Excel output:

(e) Enteer carpan			
Grade X		Grade Y	
Mean	575	Mean	577.4
Median	575	Median	575
Mode	#N/A	Mode	#N/A
Standard Deviation	6.403124	Standard Deviation	6.107373
Sample Variance	41	Sample Variance	37.3
Range	16	Range	15
Minimum	568	Minimum	573
Maximum	584	Maximum	588
Sum	2875	Sum	2887
Count	5	Count	5

	Grade X	Grade Y, Altered
Mean	575	577.4
Median	575	575
Standard deviation	6.4	6.1

When the fifth Y tire measures 588 mm rather than 578 mm, Y's mean inner diameter becomes 577.4 mm, which is larger than X's mean inner diameter, and Y's standard deviation increases from 2.1 mm to 6.1 mm. In this case, X's tires are providing better quality in terms of the mean inner diameter, with only slightly more variation among the tires than Y's.

- 3.9 (a) Half of the new houses were sold at a price no higher than \$227,200.
 - On average, the sales price of houses was \$267,900. (b)
 - The sales price of new houses was right-skewed probably because a small portion of (c) extremely expensive houses unduly biased the mean price towards the higher end.
- 3.10 (a), (b)

Cost (\$)		
Mean	7.093333	
Median	6.8	
Mode	6.5	
Standard Deviation	1.406031	
Sample Variance	1.976924	
Range	4.71	
Minimum	4.89	
Maximum	9.6	
Sum	106.4	
Count	15	
First Quartile	5.9	
Third Quartile	8.3	
CV	19.82%	

- The mean is only slightly larger than the median, so the data are only slightly right-(c) skewed.
- The mean amount spent is \$7.09 and the median is \$6.8. The average scatter of the (d) amount spent around the mean is \$1.41. The difference between the highest and the lowest amount spent is \$4.71.

3.11 (a), (b)

MPG		
Mean	25.75	
Median	23.5	
Mode	22	
Standard Deviation	6.137318	
Sample Variance	37.66667	
Range	18	
Minimum	20	
Maximum	38	
Sum	412	
Count	16	
First Quartile	21	
Third Quartile	33	
CV	23.83%	

3.11 (b) cont.

MPG	Z Score	MPG	Z Score
38	1.9960	23	-0.4481
24	-0.2851	20	-0.9369
26	0.0407	37	1.8330
21	-0.7740	22	-0.6110
25	-0.1222	20	-0.9369
22	-0.6110	33	1.1813
24	-0.2851	22	-0.6110
34	1.3442	21	-0.7740

- The mean is only slightly larger than the median, so the data are only slightly right-skewed.
- (d) The distribution of MPG of the sedans is slightly right-skewed while that of the SUVs is symmetrical. The mean MPG of sedans is 4.14 higher than that of SUVs. The average scatter of the MPG of sedans is almost 3 times that of SUVs. The range of sedans is almost 2 times that of SUVs.

3.12 (a), (b)

0)	
MPG	
Mean	21.61111
Median	22
Mode	22
Standard Deviation	2.173067
Sample Variance	4.722222
Range	10
Minimum	16
Maximum	26
Sum	389
Count	18
First Quartile	21
Third Quartile	23
CV	10.0553%

3.12 (a),(b)cont.

MPG	Z Score	MPG	Z Score
20	-0.7414	22	0.1790
22	0.1790	22	0.1790
23	0.6391	26	2.0197
22	0.1790	23	0.6391
23	0.6391	24	1.0993
22	0.1790	19	-1.2016
22	0.1790	21	-0.2812
21	-0.2812	22	0.1790
19	-1.2016	16	-2.5821

- (c) The data appears to be symmetrical since the median is about the same as the mean.
- (d) The distribution of MPG of the sedans is slightly right-skewed while that of the SUVs is symmetrical. The mean MPG of sedans is 4.14 higher than that of SUVs. The average scatter of the MPG of sedans is almost 3 times that of SUVs. The range of sedans is almost 2 times that of SUVs.

3.13 (a), (b)

j		
Number of Partners		
Mean	20.94737	
Median	21	
Mode	30	
Standard Deviation	7.074788	
Sample Variance	50.05263	
Range	23	
Minimum	9	
Maximum	32	
Sum	398	
Count	19	
First Quartile	15	
Third Quartile	29	
CV	33.77%	

3.13 (a), (b) cont.

Firm	Number of Partners	Z Score
Kennedy and Coe	24	0.43148
Mountjoy Chilton Medley	32	1.562256
Macias Gini & O'Connell	12	-1.26468
Grassi & Co.	13	-1.12334
Rea & Associates	29	1.138215
Wiss & Co.	30	1.279562
Baker Newman & Noyes	26	0.714174
Wolf & Co.	17	-0.55795
Padgett, Stratemann & Co.	15	-0.84064
Yeo & Yeo	21	0.007439
Clark Nuber	16	-0.6993
Brown Smith Wallace	23	0.290133
Jackson Thornton & Co.	21	0.007439
Yount, Hyde & Barbour	19	-0.27525
Brady, Martz & Associates	30	1.279562
Feeley & Driscoll	14	-0.98199
Frost	9	-1.68872
Dean Dorton Allen Ford	30	1.279562
LaPorte Shert Romig Hand	17	-0.55795

There is no outlier since none of the Z scores is greater than 3 or smaller than -3.

- (c) The data is quite symmetrical since the mean and the median are about the same.
- (d) The mean number of partners is 20.95 while the median number of partners is 21. The average scatter of the number of partners around the mean is 7.0748. The difference between the highest and the lowest number of partners is 23.

3.14 (a), (b)

Facebook Penetration		
Mean 34.82		
Standard Error	3.320611	
Median	37.52	
Mode	#N/A	
Standard Deviation	12.86067	
Sample Variance	165.3968	
Kurtosis	0.933459	
Skewness	-0.82106	
Range	47.99	
Minimum	4.25	
Maximum	52.24	
Sum	522.38	
Count	15	
First Quartile	28.29	
Third Quartile	46.04	
CV	36.93%	

Country	Facebook Penetration	ZScore
United States	50.19	1.194702
Brazil	25.45	-0.72899
India	4.25	-2.37743
Indonesia	18.04	-1.30517
Mexico	31.66	-0.24613
United Kingdom	49.14	1.113058
Turkey	39.99	0.401586
Philippines	28.29	-0.50816
France	37.52	0.209528
Germany	28.87	-0.46307
Italy	37.73	0.225857
Argentina	46.04	0.872013
Canada	52.24	1.354103
Colombia	38.06	0.251516
Spain	34.91	0.006583

None of the Z scores are more than 3 standard deviations away from the mean so there is not any outlier.

- (c) The mean is only slightly smaller than the median, so the data are only slightly leftskewed.
- The mean market penetration value is 34.8253 and the median is 37.52. The average (d) scatter around the mean is 12.8607. The difference between the highest and the lowest value is 47.99.

3.15 (a)

	One-Year	Five-Year
Mean	0.684167	1.472083
Median	0.8	1.58
Mode	0.9	1.6
Standard Deviation	0.304201	0.299637
Sample Variance	0.092538	0.089782
Range	0.95	1.3
Minimum	0.1	0.5
Maximum	1.05	1.8
Sum	16.42	35.33
Count	24	24
First Quartile	0.4	1.26
Third Quartile	0.9	1.66
CV	44.46%	20.35%

(b) The one-year CDs have about the same standard deviation but a slightly lower range in the yields offered than the five-year CD. Hence, you might conclude that both types of CDs have about the same amount of variation in the yields offered. But the one-year CDs do have a much higher variation relative to the average in the yields offered than the five-year CDs.

3.16 (a), (b)

Cost(U.S. \$)		
Mean	155.5	
Standard Error	3.311236	
Median	153.5	
Mode	#N/A	
Standard Deviation	9.365591	
Sample Variance	87.71429	
Kurtosis	-1.00189	
Skewness	0.664989	
Range	25	
Minimum	146	
Maximum	171	
Sum	1244	
Count	8	
First Quartile	147	
Third Quartile	166	

(c) The mean price is \$155.5 and the median is \$153.5. The average scatter around the mean is \$9.37. The difference between the highest and the lowest value is \$25.

3.16 (d) (a), (b) cont.

Cost(U.S. \$)		
Mean	159.125	
Standard Error	6.337072	
Median	153.5	
Mode	#N/A	
Standard Deviation	17.92395	
Sample Variance	321.2679	
Kurtosis	4.624552	
Skewness	2.064985	
Range	54	
Minimum	146	
Maximum	200	
Sum	1273	
Count	8	
First Quartile	147	
Third Quartile	166	

The mean price is \$159.13 and the median is \$153.5. The average scatter (c) around the mean is \$17.92. The difference between the highest and the lowest value is \$54.

The mean, standard deviation and range are sensitive to outliers. The higher price at \$200 raises the value of mean, standard deviation and range while having no impact on the median.

3.17 Excel output:

Waiting Time		
Mean	4.286667	
Median	4.5	
Mode	#N/A	
Standard Deviation	1.637985	
Sample Variance	2.682995	
Range	6.08	
Minimum	0.38	
Maximum	6.46	
Sum	64.3	
Count	15	
First Quartile	3.2	
Third Quartile	5.55	
Interquartile Range	2.35	
Coefficient of Variation	38.2112%	

3.17 (a) Mean = 4.287 Median = 4.5

cont. (b) Variance = 2.683 Standard deviation = 1.638 Range = 6.08 Coefficient of variation = 38.21% Z scores: -0.05, 0.77, -0.77, 0.51, 0.30, -1.19, -0.46, -0.66, 0.13, 1.11, -2.39, 0.51, 1.33, 1.16, -0.30 There are no outliers.

- (c) Since the mean is less than the median, the distribution is left-skewed.
- (d) The mean and median are both under 5 minutes and the distribution is left-skewed, meaning that there are more unusually low observations than there are high observations. But six of the 15 bank customers sampled (or 40%) had wait times in excess of 5 minutes. So, although the customer is more likely to be served in less than 5 minutes, the manager may have been overconfident in responding that the customer would "almost certainly" not wait longer than 5 minutes for service.

3.18 Excel output:

Waiting Time		
Mean	7.114667	
Median	6.68	
Mode	#N/A	
Standard Deviation	2.082189	
Sample Variance	4.335512	
Range	6.67	
Minimum	3.82	
Maximum	10.49	
Sum	106.72	
Count	15	
First Quartile	5.64	
Third Quartile	8.73	
Interquartile Range	3.09	
Coefficient of Variation	29.2662%	

- (a) Mean = 7.114 Median = 6.68
- (b) Variance = 4.336 Standard deviation = 2.082 Range = 6.67 Coefficient of variation = 29.27%

Waiting Time	Z Score
9.66	1.222431
5.90	-0.58336
8.02	0.434799
5.79	-0.63619
8.73	0.775786
3.82	-1.58231
8.01	0.429996
8.35	0.593286
10.49	1.62105
6.68	-0.20875
5.64	-0.70823
4.08	-1.45744
6.17	-0.45369
9.91	1.342497
5.47	-0.78987

- 3.18 (b) There is no outlier since none of the observations are greater than 3 standard deviations away from the mean. cont.
 - Because the mean is greater than the median, the distribution is right-skewed. (c)
 - The mean and median are both greater than 5 minutes. The distribution is right-skewed, (d) meaning that there are some unusually high values. Further, 13 of the 15 bank customers sampled (or 86.7%) had waiting times greater than 5 minutes. So the customer is likely to experience a waiting time in excess of 5 minutes. The manager overstated the bank's service record in responding that the customer would "almost certainly" not wait longer than 5 minutes for service.
- $\overline{R}_G = \left[(1+0.1773)(1+0.0138) \right]^{1/2} 1 = 9.25\%$ 3.19 (a)
 - If you purchased \$1,000 of GE stock at the start of 2010, its value at the end of 2011 (b) was $1000(1+0.0925)^2 = 1,193.55$.
 - The result for Taser was worse than the result for GE, which was worth \$1,193.55. (c)
- $\overline{R}_G = \left[(1+0.0108)(1+0.024) \right]^{1/2} 1 = 1.74\%$ 3.20 (a)
 - If you purchased \$1,000 of TASER stock at the start of 2010, its value at the end of (b) $2011 \text{ was } 1000(1+0.0174)^2 = 1,035.06.$
 - The result for Taser was worse than the result for GE, which was worth \$1.193.55. (c)

3.21 (a)

Year	DJIA	S&P 500	Nasdaq
2011	5.5	0	-1.8
2010	11	12.8	16.9
2009	18.8	23.5	43.9
2008	-33.8	-38.5	-40.5
Geometric mean	-2.04%	-3.79%	-0.43%

- (b) The rate of return of S&P 500 is the worst at -3.79% followed by DJIA at -2.04% and Nasdaq at -0.43%.
- Gold and silver had a much higher return than the DJIA, the S&P 500, and the (c) NASDAQ, but platinum's return was worse than the DJIA and the NASDAQ, but slightly better than the S&P 500.

3.22 (a)

Year	Platinun	Gold	Silver
2011	-21.1	10.2	-9.8
2010	21.5	29.8	83.7
2009	55.9	23.9	49.3
2008	-41.3	4.3	-26.9
Geometric mean	-3.22%	16.60%	15.96%

- Gold had a slightly higher return than silver and a much higher return than platinum. (b)
- Gold and silver had a much higher return than the DJIA, the S&P 500, and the (c) NASDAQ, but platinum's return was worse than the DJIA and the NASDAQ, but slightly better than the S&P 500.

(c) The mean three-year return of small-cap value funds is higher than that of the smallcap growth funds across the different star ratings with the exception of those rated as three-star. On the other hand, the mean three-year return of large-cap value funds is lower than that of the growth funds across the different star ratings and is lower for the mid-cap with the exception of the mid-cap two-star, three-star and five-star funds. The standard deviation of the three-year return of large-cap growth funds is higher than that of the value funds across all the star ratings.

- mean = 12857.7402, variance = 14238110.67, std. dev. = 3773.3421 (d) (a)
 - 66%, 98% and 100% of these states have average per capita energy (b) consumption within 1, 2 and 3 standard deviation of the mean, respectively.
 - This is consistent with the 68%, 95% and 99.7% according to the empirical (c) rule.
- 3.43 $\mu = 126.5 billion $\sigma = \$81.3682$ billion (a)
 - On average, the market capitalization for this population of 30 companies is (b) \$126.5 billion. The average distances between the market capitalization and the mean market capitalization for this population of 30 companies \$81.37 billion.
- cov(X, Y) = 65.29093.44 (a)
 - $S_X^2 = 21.7636, S_Y^2 = 195.8727$ (b) $r = \frac{\text{cov}(X,Y)}{\sqrt{S_X^2}\sqrt{S_Y^2}} = \frac{65.2909}{\sqrt{21.7636}\sqrt{195.8727}} = +1.0$
 - There is a perfect positive linear relationship between X and Y; all the points lie (c) exactly on a straight line with a positive slope.
- 3.45 (a) The study suggests that time spent on Facebook and grade point average are negatively correlated.
 - There could be a cause-and-effect relationship between time spent on Facebook and (b) grade point average. The more time spent on Facebook, the less time a student would have available for study and, hence, results in lower grade point average holding constant all the other factors that could have affected grade point average.

3.46 (a)
$$cov(X, Y) = 133.3333$$

(b)
$$S_X^2 = 2200, S_Y^2 = 11.4762$$

 $r = \frac{\text{cov}(X, Y)}{S_X S_Y} = 0.8391$

- (c) The correlation coefficient is more valuable for expressing the relationship between calories and sugar because it does not depend on the units used to measure calories and sugar.
- (d) There is a strong positive linear relationship between calories and sugar.

3.47 (a)

	First Weekend	US Gross	Worldwide Gross
First Weekend	947.4799		
US Gross	890.3014	1576.679

(b)

	First Weekend	US Gross	Worldwide Gross
First Weekend	1		
US Gross	0.728417	1	
Worldwide Gross	0.823319	0.964197	1

- (c) The correlation coefficient is more valuable for expressing the relationship because it does not depend on the units used.
- (d) There is a strong positive linear relationship between U.S. gross and worldwide gross, first weekend gross and worldwide gross and first weekend gross and U.S. gross.

3.48 (a)
$$cov(X, Y) = 4473270.3$$

(b)
$$S_X^2 = 956812.1336, S_Y^2 = 33480836.07$$

$$r = \frac{\text{cov}(X, Y)}{S_X S_Y} = 0.7903$$

(c) There is a positive linear relationship between the coaches' salary and revenue.

3.49 (a)
$$cov(X, Y) = 133302.7571$$

(b)
$$S_X^2 = 194992743.3, S_Y^2 = 183.7904762$$

 $r = \frac{\text{cov}(X, Y)}{S_X S_Y} = 0.7042$

- (c) There is a strong positive linear relationship between the GDP and social media use.
- 3.50 We should look for ways to describe the typical value, the variation, and the distribution of the data within a range.
- 3.51 Central tendency or location refers to the fact that most sets of data show a distinct tendency to group or cluster about a certain central point.

- 3.52 The arithmetic mean is a simple average of all the values, but is subject to the effect of extreme values. The median is the middle ranked value, but varies more from sample to sample than the arithmetic mean, although it is less susceptible to extreme values. The mode is the most common value, but is extremely variable from sample to sample.
- 3.53 The first quartile is the value below which ¼ of the total ranked observations will fall, the median is the value that divides the total ranked observations into two equal halves and the third quartile is the observation above which ¼ of the total ranked observations will fall.
- 3.54 Variation is the amount of dispersion, or "spread," in the data.
- 3.55 The Z score measures how many standard deviations an observation in a data set is away from the mean.
- 3.56 The range is a simple measure, but only measures the difference between the extremes. The interquartile range measures the range of the center fifty percent of the data. The standard deviation measures variation around the mean while the variance measures the squared variation around the mean, and these are the only measures that take into account each observation. The coefficient of variation measures the variation around the mean relative to the mean. The range, standard deviation, variance and coefficient of variation are all sensitive to outliers while the interquartile range is not.
- 3.57 The empirical rule relates the mean and standard deviation to the percentage of values that will fall within a certain number of standard deviations of the mean.
- 3.58 The Chebyshev rule applies to any type of distribution while the empirical rule applies only to data sets that are approximately bell-shaped. The empirical rule is more accurate than the Chebyshev rule in approximating the concentration of data around the mean.
- 3.59 Shape is the manner in which the data are distributed. The shape of a data set can be symmetrical or asymmetrical (skewed).
- 3.60 The arithmetic mean is appropriate if you want to obtain a typical value and serves as a "balance point" in a set of data, similar to the fulcrum on a seesaw. The geometric mean is appropriate when you want to measure the rate of change of a variable over time.
- 3.61 Skewness measures the extent to which the data values are not symmetrical around the mean. Kurtosis measures the extent to which values that are very different from the mean affect the shape of the distribution of a set of data.
- 3.62 The covariance measures the strength of the linear relationship between two numerical variables while the coefficient of correlation measures the relative strength of the linear relationship. The value of the covariance depends very much on the units used to measure the two numerical variables while the value of the coefficient of correlation is totally free from the units used.

On average, the Master Black Belt has the highest average salary (\$116,706), followed by the managers (\$90,950), the quality engineers (\$78,819), and then the Green Belts (\$64,794). The middle rank salary for the Master Black Belt (\$117,078) is also the highest, followed by the managers (\$89,500), the quality engineers (\$75,000), and then the Green Belts (\$59,700). The overall spread between the highest and lowest salary for the managers (\$689,600) is the highest, followed by the quality engineers (\$679,608), the Master Black Belt (\$206,000), and then the Green Belts (\$101,525). However, the average spread of the salary around the mean of the quality engineers (\$33,191) is the highest, followed by the Master Black Belt (\$31,064), the managers (\$30,004), and then the Green Belts (\$25,911). Relative dispersion (CV) for Quality Engineers is highest at 42% and lowest for Master Black Belts at 27%.

- Variance = 1,757.79Coefficient of variation = 97.41%
- (c) Box-and-whisker plot for Days to Resolve Complaints

Box-and-whisker Plot

The distribution is right-skewed.

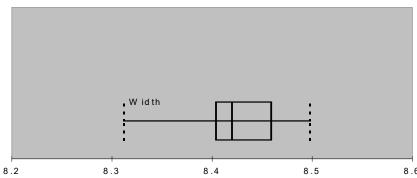

(d) Half of all customer complaints that year were resolved in less than a month (median = 28.5 days), 75% of them within 54 days. There were five complaints that were particularly difficult to settle which brought the overall mean up to 43 days. No complaint took longer than 165 days to resolve.

3.66 Excel output:

Width		
Mean	8.420898	
Standard Error	0.006588	
Median	8.42	
Mode	8.42	
Standard Deviation	0.046115	
Sample Variance	0.002127	
Kurtosis	0.035814	
Skewness	-0.48568	
Range	0.186	
Minimum	8.312	
Maximum	8.498	
Sum	412.624	
Count	49	
First Quartile	8.404	
Third Quartile	8.459	
Interquartile Range	0.055	
CV	0.55%	

- (a) mean = 8.421, median = 8.42, range = 0.186 and standard deviation = 0.0461. On average, the width is 8.421 inches. The width of the middle ranked observation is 8.42. The difference between the largest and smallest width is 0.186 and majority of the widths fall between 0.0461 inches around the mean of 8.421 inches.
- (b) Minimum = 8.312, 1st quartile = 8.404, median = 8.42, 3rd quartile = 8.459 and maximum = 8.498

Box-and-whisker Plot

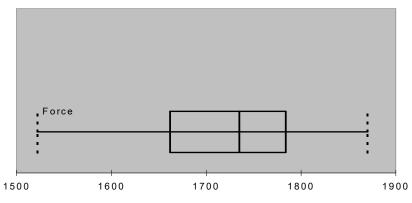

- (c) Even though the median is equal to the mean, the distribution is not symmetrical but skewed to the left.
- (d) All the troughs fall within the limit of 8.31 and 8.61 inches.

3.67 Excel output:

Force		
Mean	1723.4	
Standard Error	16.34967	
Median	1735	
Mode	1662	
Standard Deviation	89.55083	
Sample Variance	8019.352

Third Quartile	1784	
Interquartile Range	122	
CV	5.1962%	

- mean = 1723.4 median = 1735(a) range = 348standard deviation = 89.55
- The mean force required to break the insulators in the sample is 1723.4 pounds. The (b) middle ranked breaking force is 1735 pounds. The differences between the smallest and largest breaking force is 348 pounds. Roughly about 68% of the insulators will have breaking force that falls within 89.55 pounds of 1723.4 pounds.
- Five-number summary: 1522 1662 1735 1784 1870. (c)

Box-and-whisker Plot

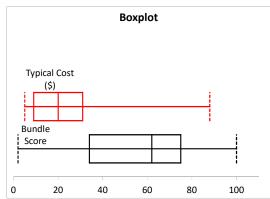

The distribution is skewed to the left.

All the observations in the sample have breaking force that is greater than 1500 pounds (d) and, hence, will fulfill the company's requirement.

3.68 (a), (b)

Bundle Score	Typical Cost (\$)

(c)

The typical cost is right-skewed, while the bundle score is left-skewed.

(d)
$$r = \frac{\text{cov}(X, Y)}{S_X S_Y} = 0.3465$$

(e) The mean typical cost is \$24.18, with an average spread around the mean equaling \$18.13. The spread between the lowest and highest costs is \$83. The middle 50% of the typical cost fall over a range of \$22 from \$9 to \$31, while half of the typical cost is below \$20. The mean bundle score is 54.775, with an average spread around the mean equaling 27.6215. The spread between the lowest and highest scores is 98. The middle 50% of the scores fall over a range of 41 from 34 to 75, while half of the scores are below 62. The typical cost is right-skewed, while the bundle score is left-skewed. There is a weak positive linear relationship between typical cost and bundle score.

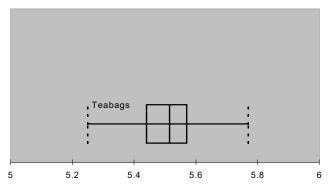

3.69 Excel output:

Teabags		
Mean	5.5014	
Standard Error	0.014967	
Median	5.515	
Mode	5.53	
Standard Deviation	0.10583	
Sample Variance	0.0112	
Kurtosis	0.127022	
Skewness	-0.15249	
Range	0.52	
Minimum	5.25	
Maximum	5.77	
Sum	275.07	
Count	50	
First Quartile	5.44	
Third Quartile	5.57	
Interquartile Range	0.13	
CV	1.9237%	

- mean = 5.5014, median = 5.515, first quartile = 5.44, third quartile = 5.57 (a)
- (b) range = 0.52, interquartile range = 0.13, variance = 0.0112, standard deviation = 0.10583, coefficient of variation = 1.924%
- The mean weight of the tea bags in the sample is 5.5014 grams while the middle ranked (c) weight is 5.515. The company should be concerned about the central tendency because that is where the majority of the weight will cluster around. The average of the squared differences between the weights in the sample and the sample mean is 0.0112 whereas the square-root of it is 0.106 gram. The difference between the lightest and the heaviest tea bags in the sample is 0.52. 50% of the tea bags in the sample weigh between 5.44 and 5.57 grams. According to the empirical rule, about 68% of the tea bags produced will have weight that falls within 0.106 grams around 5.5014 grams. The company producing the tea bags should be concerned about the variation because tea bags will not weigh exactly the same due to various factors in the production process, e.g. temperature and humidity inside the factory, differences in the density of the tea, etc. Having some idea about the amount of variation will enable the company to adjust the production process accordingly.

3.69 (d) cont.

The data is slightly left skewed.

(e) On average, the weight of the teabags is quite close to the target of 5.5 grams. Even though the mean weight is close to the target weight of 5.5 grams, the standard deviation of 0.106 indicates that about 75% of the teabags will fall within 0.212 grams around the target weight of 5.5 grams. The interquartile range of 0.13 also indicates that half of the teabags in the sample fall in an interval 0.13 grams around the median weight of 5.515 grams. The process can be adjusted to reduce the variation of the weight around the target mean.

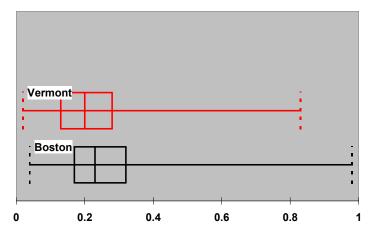

3.70 (a) Excel output:

Five-number Summary

	Boston	Vermont
Minimum	0.04	0.02
First Quartile	0.17	0.13
Median	0.23	0.2
Third	0.32	0.28
Quartile		
Maximum	0.98	0.83

(b)

Box-and-whisker Plot

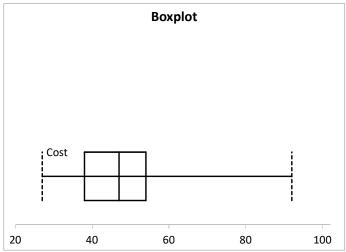

Both distributions are right skewed.

- 3.70 Both sets of shingles did quite well in achieving a granule loss of 0.8 gram or less. (c) The Boston shingles had only two data points greater than 0.8 gram. The next highest cont. to these was 0.6 gram. These two data points can be considered outliers. Only 1.176% of the shingles failed the specification. In the Vermont shingles, only one data point was greater than 0.8 gram. The next highest was 0.58 gram. Thus, only 0.714% of the shingles failed to meet the specification.
- 3.71 (a) PHStat output:

Five-Number Summary	
Minimum	27
First Quartile	38
Median	47
Third Quartile	54
Maximum	92

(b)

The distribution of the price is right-skewed because of a few extremely expensive restaurants.

- r = 0.6573. There is a moderate positive linear relationship between the (c) price and rating of the restaurants. The higher priced restaurants tend to receive higher rating than the lower priced restaurants.
- 3.72 (a), (b), (c)

	Calories	Protein	Cholesterol
Calories	1		
Protein	0.464411	1	
Cholesterol	0.177665	0.141673	1

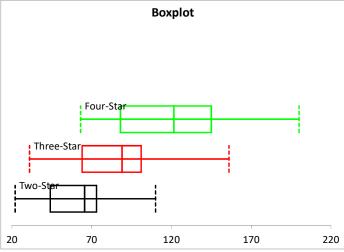

There is a rather weak positive linear relationship between calories and protein with a correlation coefficient of 0.46. The positive linear relationship between calories and cholesterol is quite weak at .178.

3.73 (a),(b) PHStat output:

	Two-Star	Three-Star	Four-Star
Mean	60.78846	85.28846	119.8077
Median	65.5	89	121.5
Mode	73	101	64

Sample Variance	378.1701	676.4054	1229.335
Kurtosis	-0.04925	0.005502	-0.66151
Skewness	0.064656	0.09198	0.250662
Range	88	125	137
Minimum	22	31	63
Maximum	110	156	200
Sum	3161	4435	6230
Count	52	52	52
First Quartile	44	64	88
Third Quartile	73	101	145
Interquartile Range	29	37	57
CV	31.99%	30.49%	29.27%

(c) The average prices of the two-star, three-star and four-star hotels are 60.79, 85.29 and 119.81 English pounds, respectively while the middle rank prices are 65.5, 89 and 121.5 English pounds, respectively. The difference in prices between the lowest and highest price hotels of the two-star, three-star and four-star hotels are 88, 125 and 137 English pounds, respectively while the difference in prices among the middle 50% hotels are 29, 37 and 57 English pounds, respectively. The average spread of the prices around the mean for the two-star, three-star and four-star hotels are 19.45, 26.01 and 35.06 English pounds, respectively. The amount of average spread around the mean in relative to the mean prices of the two-star, three-star and four-star hotels are 31.99%, 30.49% and 29.27%, respectively.

(d)

The prices of the two-star, three-star and four-star hotels are all right-skewed.

3.73 Covariance Matrix (e) cont.

	Two-Star	Three-Star	Four-Star
Two-Star	378.1701		
Three-Star	443.0034	676.4054	
Four-Star	450.3507	778.8605	1229.335

(f) Correlation coefficient matrix

	Two-Star	Three-Star	Four-Star
Two-Star	1		
Three-Star	0.875911	1	
Four-Star	0.660499	0.851548	1

- The correlation coefficient is more valuable for expressing the relationship because it (g) does not depend on the units used.
- The average price of a room at two-star, three-star, and four-star hotels are all linearly (h) positively related to each other.

3.74 (a), (b)

Property Taxes Per Capita (\$)		
Mean	1323.784314	
Median	1239	
Mode	#N/A	
Standard Deviation	563.0223198

Statistics For Managers Using Microsoft Excel 7th Edition Levine Solutions Manual

Full Download: https://testbanklive.com/download/statistics-for-managers-using-microsoft-excel-7th-edition-levine-solutions-man

168 Chapter 3: Numerical Descriptive Measures

3.77 cont.

The amount of % alcohol is right skewed and average at 5.2201%. Half of the beers have % alcohol below 4.9%. The middle 50% of the beers have alcohol content spread over a range of 1.2%. The highest alcohol content is at 11.5% while the lowest is at 0.4%. The average scatter of alcohol content around the mean is 1.4243%.

The number of calories is right-skewed and average at 153.86. Half of the beers have calories below 150. The middle 50% of the beers have calories spread over a range of 37. The highest number of calories is 330 while the lowest is 55. The average scatter of calories around the mean is 44.5432.

The number of carbohydrates is right-skewed from the boxplot and average at 12.0181, which is slightly lower than median at 12.1. Half of the beers have carbohydrates below 12.1. The middle 50% of the beers have carbohydrates spread over a range of 5.9. The highest number of carbohydrates is 32.1 while the lowest is 1.9. The average scatter of carbohydrates around the mean is 4.9161.
